## **1 INTRODUCTION**

NSTAR Electric Company d/b/a Eversource Energy (“Eversource”) is proposing to build an approximately 9 mile 115-kilovolt (kV) underground transmission line between Eversource’s existing Sudbury substation in Sudbury, Massachusetts, and the Hudson Light & Power Company’s (HL&P) substation in Hudson, Massachusetts. The new underground transmission line will traverse the municipalities of Sudbury, Hudson, Stow, and Marlborough, Massachusetts. Approximately 7.5 miles of the new transmission line will be installed within an inactive Massachusetts Bay Transportation Authority (MBTA) railroad right-of-way (ROW). Eversource has coordinated with the Massachusetts Department of Conservation and Recreation (DCR) to develop a two-phased project in which a portion of the Massachusetts Central Rail Trail (MCRT) will be co-located with the new transmission line. Phase I is the responsibility of Eversource and will include the installation of the underground transmission line, all major earthwork, installation of the stormwater management system, construction of a 14-foot gravel road, construction/renovation of Bridges 128 and 127, site restoration, and implementation of all mitigation. Phase II is the responsibility of DCR and will include the paving of the MCRT, installation of safety plantings and other trail amenities, and long-term maintenance of the corridor.

The Town of Sudbury, per requirements of the Sudbury Wetlands Administration Bylaw, requires mitigation of adjacent upland resource areas (AURAs) through invasive species management per the Order of Conditions (OOC) issued to Eversource and DCR (MassDEP File# 301-1287). AURAs generally consist of land within 100 feet of wetland resource areas and land within 200 feet from the top of bank of perennial streams and rivers.

Prior to the commencement of each project phase, Special Condition Part I(r) of the OOC requires that invasive species presence along the corridor be mapped within and adjacent to the limit of work (LOW). This invasive species management plan includes mapping to satisfy the conditions of the permit (Figures 1 and 2). The intent of the pre-construction mapping and data collection is to create a baseline map identifying invasive plant populations existing along the ROW prior to the commencement of construction activities. The mapping and data collection provides critical information necessary for the development of this invasive plant management plan.

Special Condition Part II specific to Phase I(b) requires submittal of an invasive species management plan to the Sudbury Conservation Commission 4 weeks prior to any land disturbance. The management plan specifically involves the removal and management of invasive species and revegetation with native species for a period of 5 years for a minimum of 3.3 acres of land within the MBTA ROW, but outside of the proposed LOW. This document satisfies this condition. The intent of the invasive species management efforts at the project site is to improve wildlife habitat.

This plan includes details regarding the pre-construction assemblage and dissemination of invasive species along the project corridor in Sudbury, proposed management activities, post-management restoration, and post-management site monitoring and reporting.

## **2 PRE-CONSTRUCTION CONDITIONS**

A baseline inventory survey identifying all invasive species located along the ROW in the Sudbury portion of the project was conducted in July 2021. Data are provided in tabular form in Appendix A and global positioning system (GPS)-based mapping is provided as Figure 1. Representative project photographs are provided in Appendix B.

Baseline surveys involved identifying individual stands of invasive plant species along the entire ROW. Invasive plant survey technicians made note of access constraints, habitat improvement potential, and proximity to off-ROW populations of invasive plant species. Populations were documented as polygons via GPS units. Density of the population and exact species of the invasive plants present were noted and documented.

## 2.1 Invasive Plant Species Present

The invasive plant species located within the ROW are listed in Table 1, and noted in Figure 1, Invasive Species Management Plan Mapbook, and in Appendix A.

**Table 1. Invasive Plant Species Present**

Common Name	Scientific Name
Common reed	<i>Phragmites australis</i>
Purple loosestrife	<i>Lythrum salicaria</i>
Japanese barberry	<i>Berberis thunbergii</i>
Asiatic bittersweet	<i>Celastrus orbiculatus</i>
Autumn olive	<i>Elaeagnus umbellata</i>
Morrow's honeysuckle	<i>Lonicera morrowii</i>
Japanese knotweed	<i>Polygonum cuspidatum</i>
Glossy buckthorn	<i>Rhamnus frangula</i>
Multiflora rose	<i>Rosa multiflora</i>
Black locust	<i>Robinia pseudoacacia</i>
Garlic mustard	<i>Alliaria petiolata</i>
Norway maple	<i>Acer platanoides</i>
Reed canary grass	<i>Phalaris arundinacea</i>
Burning bush	<i>Euonymus alatus</i>
Tree of heaven	<i>Ailanthus altissima</i>

## 2.2 Invasive Plant Species Prevalence

As noted, invasive plant polygons were documented along the ROW in Sudbury. The recorded pre-construction data include species identification, polygon limits of infestation (area calculation), and percent cover of the invasive species within the documented polygon. Each population was assigned a Feature ID which was coded with the town initials, scientific name abbreviation, and series population number.

Table 2 (below) indicates the invasive species observed along the ROW in terms of prevalence relative to area size (square feet). The species in Table 2 are presented from most prevalent invasive plant species to least abundant along the ROW.

**Table 2. Invasive Plant Species Prevalence along the ROW**

Common Name	Scientific Name	ROW Area Total (square feet)
Glossy buckthorn	<i>Rhamnus frangula</i>	1,140,959.00
Asiatic bittersweet	<i>Celastrus orbiculatus</i>	411,722.00
Morrow's honeysuckle	<i>Lonicera morrowii</i>	160,120.90
Multiflora rose	<i>Rosa multiflora</i>	85,501.58
Norway maple	<i>Acer platanoides</i>	78,239.94
Japanese barberry	<i>Berberis thunbergii</i>	34,108.00
Purple loosestrife	<i>Lythrum salicaria</i>	31,556.48
Burning bush	<i>Euonymus alatus</i>	21,765.56
Common reed	<i>Phragmites australis</i>	18,897.14
Garlic mustard	<i>Alliaria petiolata</i>	17,642.32
Japanese knotweed	<i>Polygonum cuspidatum</i>	10,473.98
Autumn olive	<i>Elaeagnus umbellata</i>	8,851.25
Reed canary grass	<i>Phalaris arundinacea</i>	8,337.65
Black locust	<i>Robinia pseudoacacia</i>	1,218.51
Tree of heaven	<i>Ailanthus altissima</i>	3.14

## 3 INVASIVE MANAGEMENT PLAN

To establish which locations would be most suitable for invasive plant management, mitigation GIS specialists analyzed the recorded data regarding the location of invasive plant populations relative to the different components of the ROW and project. These include the LOW, ROW limits, and area located within the ROW but outside of the LOW (identified as the Area Within Management Zone). Recorded invasive plant data were then detailed across each of these three zones.

Each location was ranked regarding treatment location parameters such as access to the populations, whether the management of the invasive plants will be beneficial to wildlife habitat, and if the management of each population is feasible. The mitigation goal is associated with locally regulated Adjacent Upland Resource Area, and as such vegetated wetlands were not specifically targeted for mitigation at this project. The limitation of management options also poses potential risk to resource areas as the allowable management means are physical in nature and involve soil disturbance. This factor was also considered regarding the location of proposed invasive plant management along the ROW.

The most ideal treatment areas would be entirely confined by the limits of the ROW (populations do not extend beyond the ROW). Invasive plant populations identified within the LOW will be managed through the construction project and will not be considered as invasive plant management detailed in the OOC under Special Condition Part II specific to Phase I(b).

### 3.1 Areas Identified for Invasive Plant Management

SWCA and the Town of Sudbury Conservation Commission Administrator conducted a site visit to field-verify each location of invasive species identified along the ROW and discussed whether each population should be considered for management. The Town provided feedback regarding priority management areas

to consider managing across the ROW and are presented in Table 3 below. Mapping was finalized identifying ideal treatment areas (Figure 2) along the Sudbury portion of the ROW. The target management area as set in the OOC associated with the project is 3.3 acres. During the site visit, 11.38 acres of individual invasive plant populations were located along the Sudbury ROW. The populations and the field notes from the meeting with the Town were reviewed and it was concluded that 3.64 acres of the ROW outside the LOW would be targeted for management for this project.

Table 3 summarizes the locations individual populations of invasive species targeted for invasive plant management (outside of the LOW).

**Table 3. Locations Targeted for Invasive Plant Management**

SU-ROPS-177	3.14	Over 90%

It should be noted that the information presented in Table 3 includes the total area per population delineated during the invasive species management survey. Often populations for one species overlap populations for other species. This area calculation (presented in Table 3) does not consider the population overlap.

## 3.2 Initial Methods of Management

Methods for managing the invasive plant species identified on the ROW were analyzed and discussed with the Town of Sudbury Conservation Commission Administrator. All methods of managing invasive plant species were considered and assessed by species targeted for control and location of the invasive plant populations. It should be noted that the Siting Board Permit (Energy Facility Siting Board Final Decision (EFSB 17-02, DPU 17-82 & 83), dated Dec. 18, 2019, Condition F) does not allow for the use of herbicides within the entire ROW. Therefore, to abide by this permit condition invasive plant management will not be achieved by way of herbicide applications. To eliminate any risk of destabilization of wetland resource areas no invasive plant management is being proposed for jurisdictional wetland resource areas (all state and local jurisdictional areas). This plan provides guidance for invasive plant management and is a living document that may be adjusted as necessary during the project. This section summarizes the invasive plant management techniques proposed along the ROW. It should be noted that the management areas will be accessed by way of the proposed construction, since access for equipment and personnel is not available currently.

*Condition F. The Siting Board directs Eversource to utilize mechanical vegetation management along the MBTA ROW. Further, if Eversource finalizes an MOU with DCR for vegetation management along the MCRT, Eversource shall incorporate the same provision in the MOU. If DCR does not agree to the inclusion of this provision in the MOU, Eversource shall submit a report to the Siting Board describing DCR's objections for the Board's consideration.*

### **3.3 Clearing and Grubbing**

Clearing and grubbing is proposed as the method of management best suited for invasive species within the ROW. Invasive plant management professionals may consider alternative means of managing invasive species if site conditions dictate that clearing and grubbing would not be suitable. Conditions where this might be considered include the topography of the management area, access to the management area, off ROW adjacent land use potential impact to native species. This method is not suitable for all invasive plant species as some species are unlikely to be managed successfully with the employment of this method. *This method should be avoided for the following species: phragmites, Japanese knotweed, and garlic mustard.* Clearing and grubbing will successfully eliminate much of the woody invasive vegetation present within the management area. However, some resprouting will be expected the following spring. Clearing woody invasive plant material involves cutting the targeted plant to the base, chipping the waste material, and removing the root flare from the ground. If possible, clearing activities should occur during plant dormancy or when the targeted plant species have not produced fruit. This timing would prevent seed development from the invasive plants prior to grubbing, which should reduce the risk of spreading invasive plant propagules through this action.

The contractor conducting the clearing and grubbing activities associated with the invasive plant management shall take care when operating machinery within invasive-populated areas. Extra care should be taken when transporting equipment from areas with established stands of phragmites and Japanese knotweed, as machine tracks may spread the root/rhizome fragments and lead to proliferation of these two species in other sections of the project work zone. No grubbing activities should occur within populations of phragmites or Japanese knotweed.

Site restoration activities should be implemented in conjunction with the clearing and grubbing operations to ensure that restoration vegetation is installed immediately following the removal of the invasive plant material. This should increase the potential of successfully restoring these management areas. See Section 4, Site Restoration, for further details.

### **3.4 Follow-up Management**

Five years of invasive plant management is required per the OOC under Special Condition Part II specific to Phase I(b). Follow-up management activities will occur for five years from the start of construction in an attempt to reduce or eradicate invasive species found within the proposed management areas (see Table 3). Invasive species monitoring should occur each year that management has occurred (see Section 5). The follow-up management actions should be in response to the data recorded and analyzed annually. In general, the intent of the follow-up management is to continue the efforts to reduce and potentially eliminate invasive species from the managed areas. It is possible that invasive plants may resprout or entirely new populations may develop in the management areas during the monitoring period.

Follow-up management should be performed via hand-pulling/removal or mechanical grubbing. The method used by the invasive plant managers will be specific to the target plant, size of population needing treatment, and the location of the target plant. Target plants will only be managed up to the work limits (edge of ROW) and no further. The plants to be managed during follow-up applications include all invasive species located in the project management areas and thus are not limited to species previously observed.

Hand removal can be performed for smaller populations and for target woody species. Herbaceous species likely will not be the best candidates for this method of management and will require herbicide applications.

## 4 SITE RESTORATION

It is imperative that locations where any invasive species management efforts are conducted that site restoration occur. The timing of the site restoration activities will be specific to the invasive plant management efforts. In most instances, areas disturbed via invasive plant management activities should be seeded immediately following invasive plant operations with native seed mixtures specifically suitable for the locations where the management has occurred. Seeding should occur in all locations where invasive species management occurs. This will aid in stabilizing any disturbed soils and will offer native plant competition in an effort of reducing colonization of invasive plants within the disturbed areas.

Restoration plantings will be considered for all areas where invasive plant populations have been managed. However, care should be taken to not prematurely install vegetation prior to being confident that invasive plant populations have been successfully managed. Plant material proposed for restoration should be approved by the Conservation Commission's Agent prior to installation. Material should be native to the county, found along the ROW, and appropriate for the habitat being restored.

## 5 INVASIVE SPECIES MONITORING

Initial invasive plant species monitoring along the ROW is proposed to occur during the first growing season following the initial management efforts, and each year for 4 years thereafter (total of 5 years of annual monitoring). Conclusions will be drawn as to the overall success of the invasive management program, and comparison will be made between the assemblage of invasive species prior to construction (2021 data) and the state of invasive prevalence each year within the monitoring period.

Monitoring will involve the same methods employed during the pre-construction survey. Each mapped management location within the ROW will be assessed annually. Invasive plant specialist will delineate the edge of each managed invasive population with a submeter-accurate mobile GPS unit. The monitor will assign a percent cover value for each species throughout the GPS-recorded polygon. Percent cover in a polygon is estimated by observing the total area covered by the leaf structure of all individual plants of a certain species as it relates to the total area of the treatment area (polygon). It is possible for all percent cover values assigned within a management area to sum larger than 100%, as it is possible for the leaves of multiple plants to overlap vertically. Photograph documentation will also be collected for each monitored management location.

All field data recorded will be compiled into a spreadsheet with the following information for each location: feature ID, date of survey, map sheets where location can be found, invasive plant species present, respective percent cover information, total percent cover of all invasive plants within the polygon, and any pertinent notes regarding invasive plants, access, or treatment recommendations. All GPS-located invasive polygons will be projected on a GIS mapping program (ArcMap). Map sheets will be compared to previous years' polygon data when possible. A new annotated set of Map sheets will be provided with every monitoring report for the remainder of the monitoring period.

A report will be submitted annually (by December 1) documenting the findings of the invasive species monitoring activities. Comparisons will be made across management years and in relation to the pre-construction monitoring findings. The report will include methods of management completed in the monitoring year and proposed management efforts for the following year. Restoration efforts will also be assessed for each managed location. Plant installation and seed mix installation will be considered for each location, depending on site conditions at the time of the monitoring visit. The report will identify whether the mitigation currently meets the success standard set in the OOC (Part II, Phase I, 8.y). This

condition identifies that the mitigation areas will be deemed substantially in compliance when there is a minimum of 90% cover with native species and free of invasive species.

## **6 SUMMARY**

As stated, invasive species management will not be performed prior to the approval of this plan and prior to the start of construction activities on site. It is anticipated that the initial invasive species control effort will be conducted in 2022 or 2023 depending on the construction schedule. Follow-up invasive species management activities will occur annually in the summer months for five years following the initial management efforts. Site monitoring visits will be conducted annually in the summer/early fall of each of the five years. These inspections will include documentation of the proposed management locations specifically identified in this management plan.

NO.	DATE	REVISIONS

This legend identifies various vegetation types and wetland areas. The first column lists species names with their common names in parentheses: CEOR7 - Asiatic Bittersweet, ELUM - Autumn Olive, ROPS - Black Locust, FRANG - Buckthorn, DIERV - Bush Honeysuckle, and ALPE4 - Garlic Mustard. The second column lists species names with their common names in parentheses: BETH - Japanese Barberry, POCU6 - Japanese Knotweed, ROMU - Multiflora Rose, ACPL - Norway Maple, PHAU7 - Phragmites, and LYSA2 - Purple Loosestrife. The third column lists species names with their common names in parentheses: PHAR3 - Reed Canary Grass, AIAL - Tree of Heaven, EUAL13 - Winged Euonymus, and Delineated Wetlands.

CEOR7 - Asiatic Bittersweet	BETH - Japanese Barberry	PHAR3 - Reed Canary Grass
ELUM - Autumn Olive	POCU6 - Japanese Knotweed	AIAL - Tree of Heaven
ROPS - Black Locust	ROMU - Multiflora Rose	EUAL13 - Winged Euonymus
FRANG - Buckthorn	ACPL - Norway Maple	Delineated Wetlands
DIERV - Bush Honeysuckle	PHAU7 - Phragmites	
ALPE4 - Garlic Mustard	LYSA2 - Purple Loosestrife	

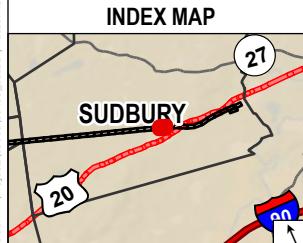

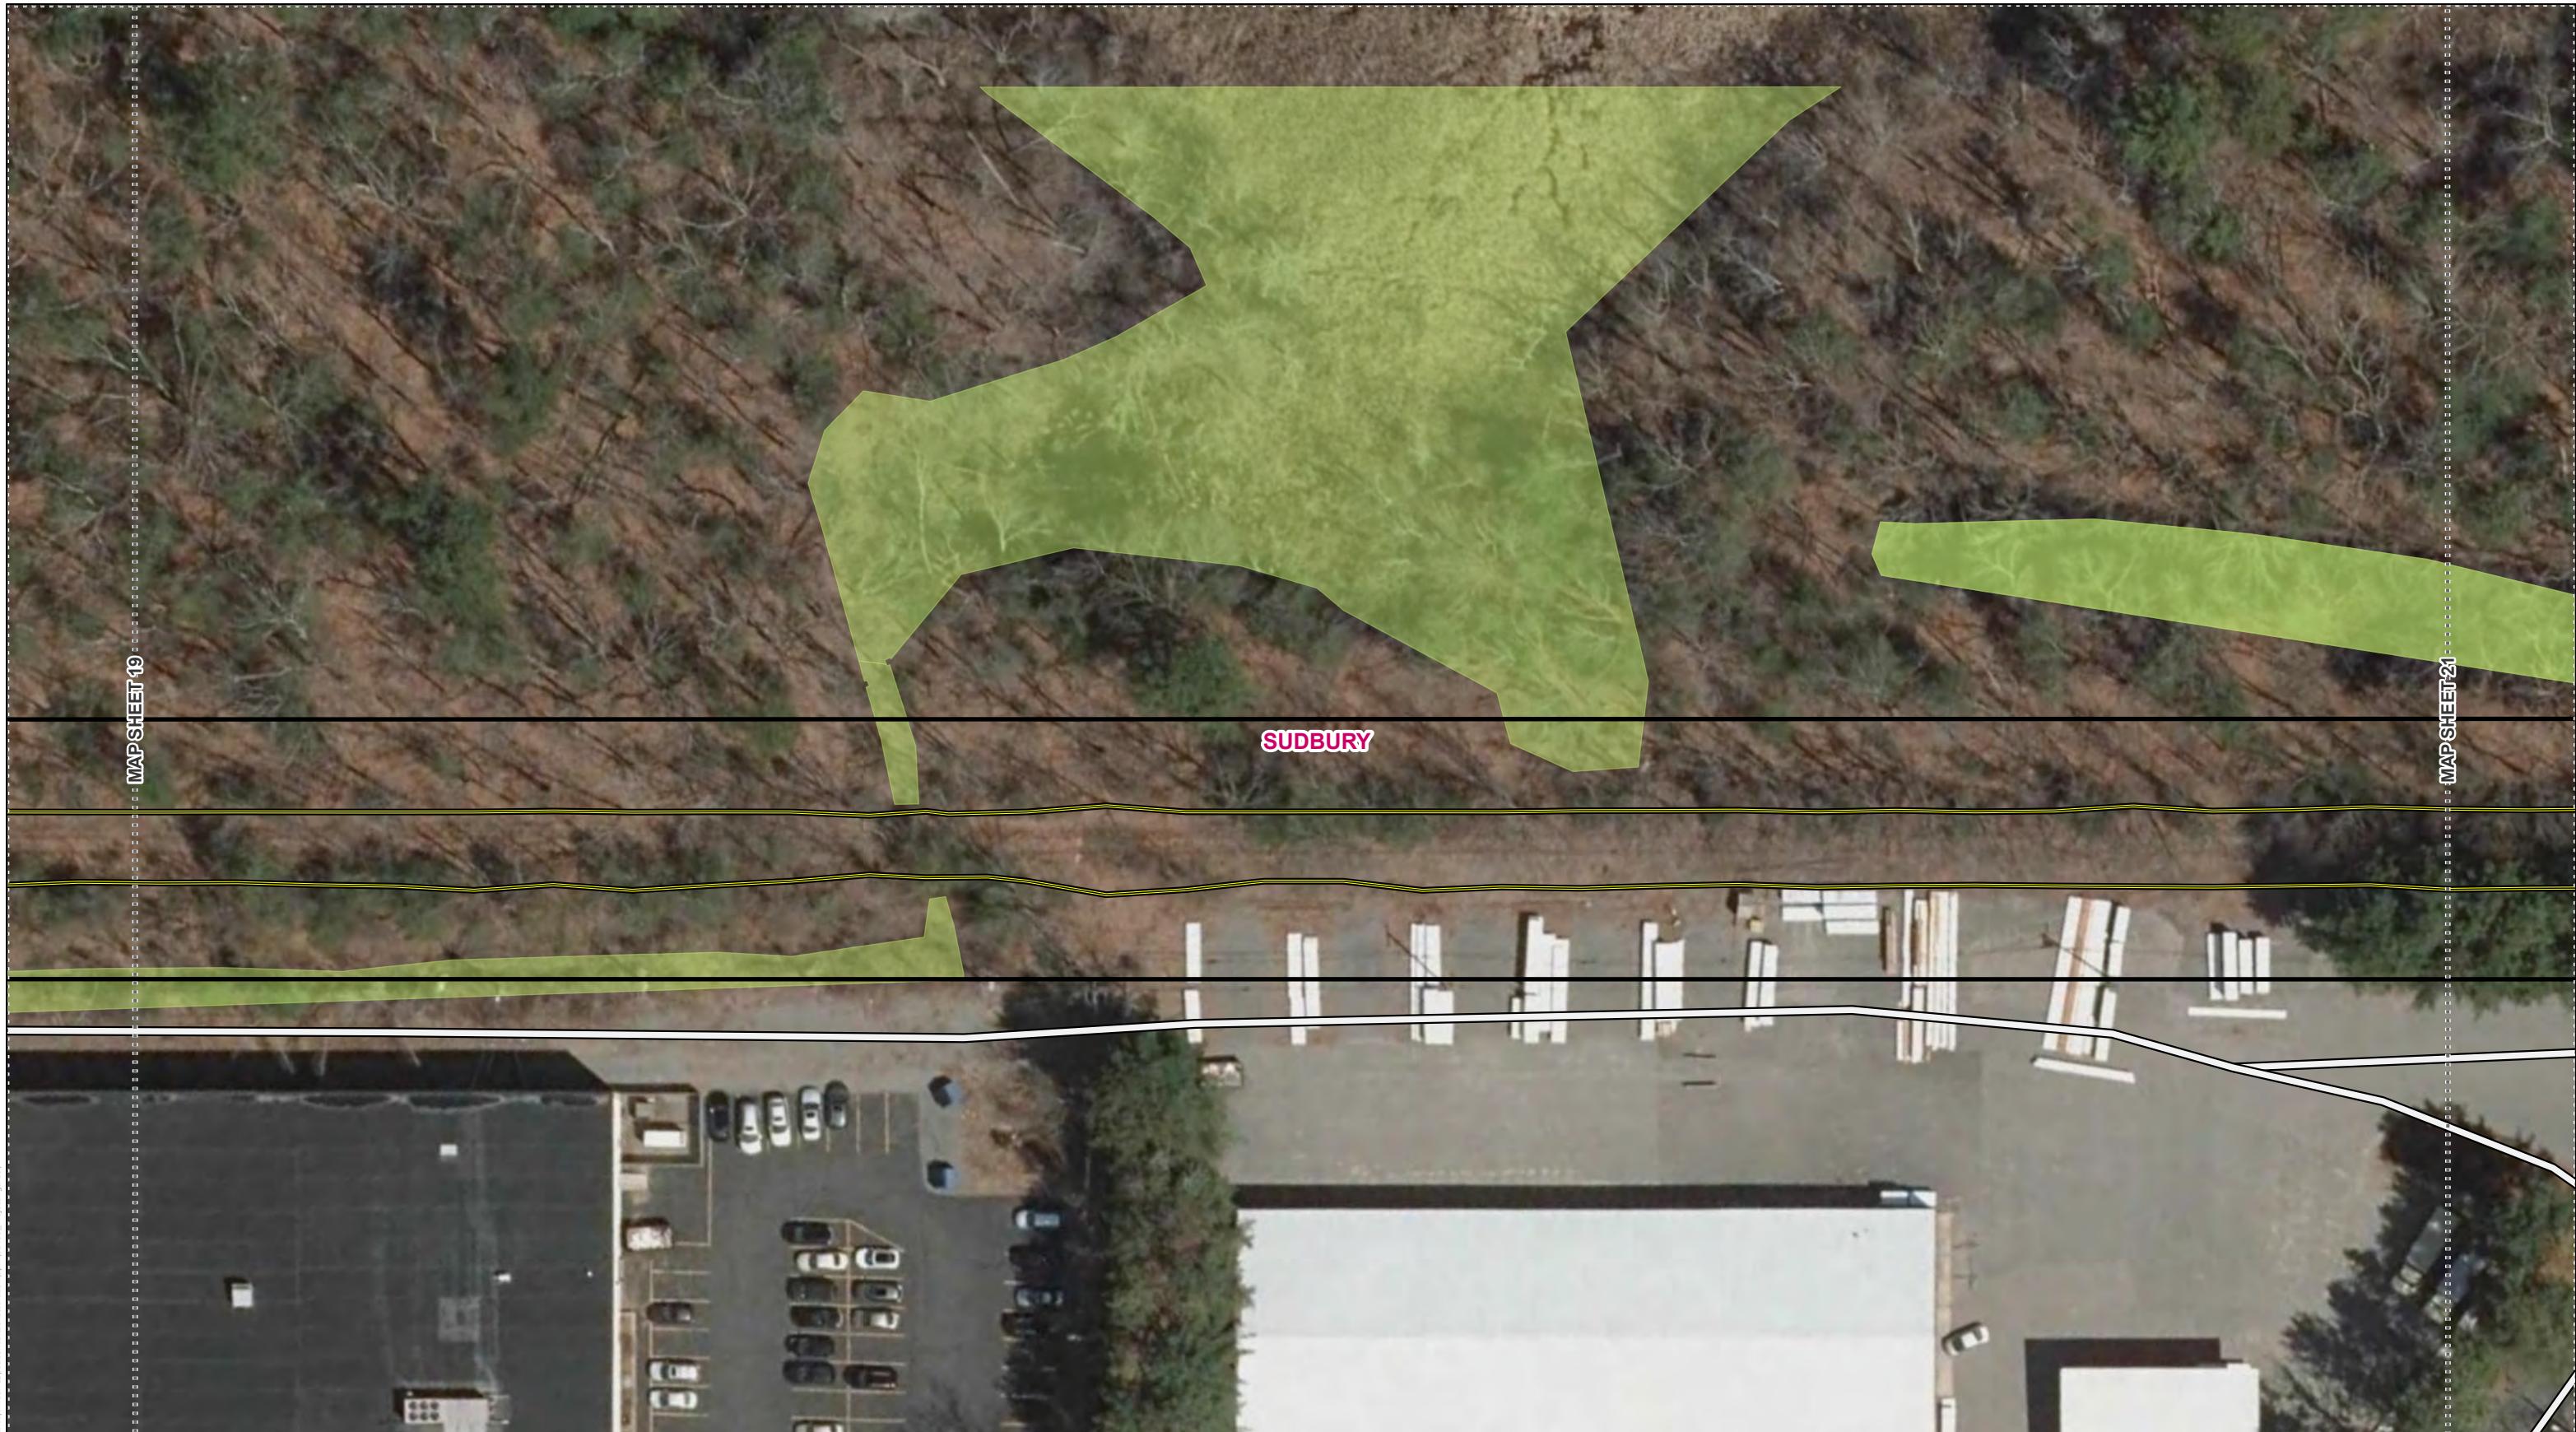

A north arrow pointing diagonally up and to the left, with a scale bar below it.
