Category: 120 DY
ROA Class Desc: A temporary cleanup. Although the site does not present a 'substantial hazard', it has not reached a level of no significant risk. The site must be evaluated every five years to determine whether a Class A or Class B RAO is possible. All sites are expected eventually to receive a Class A or B RAO.
Phase Desc: Operation, Maintenance, and/or Monitoring. During Phase V, long-term treatment processes are implemented and monitored to track cleanup progress.
Release Type Desc: (Response Action Outcome): A site/release where an RAO Statement was submitted. An RAO Statement asserts that response actions were sufficient to achieve a level of no significant risk or at least ensure that all substantial hazards were eliminated.
Status Desc: Response Action Outcome

109	3 of 8	ESE	0.05 / 283.47	154.88 / -39	NO LOCATION AID 209 BOSTON POST ROAD SUDBURY MA 01776-0000	LST
---------------------	--------	-----	---------------	--------------	--	-----

Site No: 3-0033240
Source: FUEL TANK, PIPE, TANK, UNKNOWN, UST, USTOTHER
Release Type: TIER 2
Chemical Type: Oil
Category: 72 HR
ROA Class Desc:
Phase Desc: Comprehensive Site Assessment. During Phase II, the risks posed to public health, welfare, and the environment are determined.
Release Type Desc: A site/release receiving a total NRS score of less than 350, unless the site meets any of the Tier 1 Inclusionary Criteria (see above). Permits are not required at Tier 2 sites/releases and response actions may be performed under the supervision of an LSP without prior DEP approval. All pre-1993 transition sites that have accepted waivers are categorically Tier 2 sites.
Status Desc: Tier 2

HMIS Gen Pkg Type: DRUM METAL
HMIS Container Code: 17C
HMIS Container Desc: Steel STC* RHA*
HMIS Bulk Incident: No
Undeclared Shipment: No

ONE LEAKING 5 GAL. DRUM WAS DISCOVERED WHILE UNLOADING AT THE SHIPLEY CO., IN MARLBORO, MA. ON 12-03-90 AT APPROXIMATELY 1605 HRS. THE DRUM CONTAINED SODIUM PROMANGANATE 40% AND WAS IN THE MIDDLE ON THE TOP TIER OF A STRETCHED WRAPPED PALLET. APPARENTLY THE METAL WIRE HANDLE HAD BEEN STRUCK DURING LOADING OR UNLOADING PRIOR TO ARRIVING AT THE FARMINGHAM TERMINAL. THE IMPACT BROKE THE SEAL AROUND THE LID AND ALLOWED APPROXIMATELY 1/2 TO 1 PINT OF SODIUM PROMANGANATE 40% TO LEAK OUT DURING TRANSPORT. THE SODIUM PROMANGANATE CONTAMINATED SOME OF THE OTHER DRUMS, STRETCH WRAP AND THE SKID. NO HM LIQUID TOUCHED THE TRAILER FLOOR. ENVIRONMENTAL SPECIALIST FROM SPRINGFIELD, MA. WERE CALLED TO THE SCENE WHERE THEY CLEANED AND DISPOSED OF THE SKID AND STRETCH WRAP. THE REMAINING 5 GAL. DRUMS WERE ALSO CLEANED AND ACCEPTED BY THE CONSIGNEE. THE LEAKING DRUM WAS PLACED IN A PROPER HM CONTAINER BY ENVIRONMENTAL SPECIALISTS AND BROUGHT BACK TO THE TERMINAL. IT HAS BEEN RETURNED TO THE SHIPPER - CARUS CHEMICAL CO. THE DRIVER MARK WEBBER COMPLAINED OF SORE THROAT AND A HEADACHE APPARENTLY FROM INHALING FUMES FROM THE SPILL. HE WAS TREATED AT UNIVERSITY OF MA. MEDICAL CENTER ON 12/4/90. HE RETURNED TO WORK ON 12/5/90 WITH A FULL RELEASE FROM THE DOCTOR.

Appendix: Database Descriptions

Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13, Section 8.1.8 Sources of Standard Source Information:

"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."

Standard Environmental Record Sources

Federal

Facility Response Plan:

FRP

List of facilities that have submitted Facility Response Plans (FRP) to EPA. Facilities that could reasonably be expected to cause "substantial harm" to the environment by discharging oil into or on navigable waters are required to prepare and submit Facility Response Plans (FRPs). Harm is determined based on total oil storage capacity, secondary containment and age of tanks, oil transfer activities, history of discharges, proximity to a public drinking water intake or sensitive environments.

Government Publication Date: Mar 26, 2020

National Priority List:

NPL

National Priorities List (Superfund)-NPL: EPA's (United States Environmental Protection Agency) list of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. The NPL, which EPA is required to update at least once a year, is based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action.

Government Publication Date: Sep 22, 2020

National Priority List - Proposed:

PROPOSED NPL

Includes sites proposed (by the EPA, the state, or concerned citizens) for addition to the NPL due to contamination by hazardous waste and identified by the Environmental Protection Agency (EPA) as a candidate for cleanup because it poses a risk to human health and/or the environment.

Government Publication Date: Sep 22, 2020

Deleted NPL:

DELETED NPL

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Government Publication Date: Sep 22, 2020

SEMS List 8R Active Site Inventory:

SEMS

The Superfund Program has deployed the Superfund Enterprise Management System (SEMS), which integrates multiple legacy systems into a comprehensive tracking and reporting tool. This inventory contains active sites evaluated by the Superfund program that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Active Site Inventory Report displays site and location information at active SEMS sites. An active site is one at which site assessment, removal, remedial, enforcement, cost recovery, or oversight activities are being planned or conducted.

Government Publication Date: Aug 26, 2020

Inventory of Open Dumps, June 1985:

ODI

The Resource Conservation and Recovery Act (RCRA) provides for publication of an inventory of open dumps. The Act defines "open dumps" as facilities which do not comply with EPA's "Criteria for Classification of Solid Waste Disposal Facilities and Practices" (40 CFR 257).

Government Publication Date: Jun 1985

SEMS List 8R Archive Sites:

[SEMS ARCHIVE](#)

The Superfund Enterprise Management System (SEMS) Archived Site Inventory displays site and location information at sites archived from SEMS. An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time.

Government Publication Date: Aug 26, 2020

Comprehensive Environmental Response, Compensation and Liability Information System -

[CERCLIS](#)

CERCLIS:

Superfund is a program administered by the United States Environmental Protection Agency (EPA) to locate, investigate, and clean up the worst hazardous waste sites throughout the United States. CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The EPA administers the Superfund program in cooperation with individual states and tribal governments; this database is made available by the EPA.

Government Publication Date: Oct 25, 2013

EPA Report on the Status of Open Dumps on Indian Lands:

[IODI](#)

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified congressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

Government Publication Date: Dec 31, 1998

CERCLIS - No Further Remedial Action Planned:

[CERCLIS NFRAP](#)

An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. The Archive designation means that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Government Publication Date: Oct 25, 2013

CERCLIS Liens:

[CERCLIS LIENS](#)

A Federal Superfund lien exists at any property where EPA has incurred Superfund costs to address contamination ("Superfund site") and has provided notice of liability to the property owner. A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Jan 30, 2014

RCRA CORRACTS-Corrective Action:

[RCRA CORRACTS](#)

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. At these sites, the Corrective Action Program ensures that cleanups occur. EPA and state regulators work with facilities and communities to design remedies based on the contamination, geology, and anticipated use unique to each site.

Government Publication Date: Jul 27, 2020

RCRA non-CORRACTS TSD Facilities:

[RCRA TSD](#)

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. This database includes Non-Corrective Action sites listed as treatment, storage and/or disposal facilities of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Government Publication Date: Jul 27, 2020

RCRA Generator List:

[RCRA LQG](#)

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Large Quantity Generators (LQGs) generate 1,000 kilograms per month or more of hazardous waste or more than one kilogram per month of acutely hazardous waste.

Government Publication Date: Jul 27, 2020

RCRA Small Quantity Generators List:

[RCRA SQG](#)

RCRA Info is the EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Small Quantity Generators (SQGs) generate more than 100 kilograms, but less than 1,000 kilograms, of hazardous waste per month.

Government Publication Date: Jul 27, 2020

RCRA Conditionally Exempt and Very Small Quantity Generators List:

[RCRA CESQG](#)

RCRA Info is the EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Conditionally Exempt and Very Small Quantity Generators (VSQG and CESQG) generate 100 kilograms or less per month of hazardous waste, or one kilogram or less per month of acutely hazardous waste. Additionally, VSQG and CESQG may not accumulate more than 1,000 kilograms of hazardous waste at any time.

Government Publication Date: Jul 27, 2020

RCRA Non-Generators:

[RCRA NON GEN](#)

RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA Info replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS) and the Biennial Reporting System (BRS). A hazardous waste generator is any person or site whose processes and actions create hazardous waste (see 40 CFR 260.10). Non-Generators do not presently generate hazardous waste.

Government Publication Date: Jul 27, 2020

Federal Engineering Controls-ECs:

[FED ENG](#)

Engineering controls (ECs) encompass a variety of engineered and constructed physical barriers (e.g., soil capping, sub-surface venting systems, mitigation barriers, fences) to contain and/or prevent exposure to contamination on a property. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Aug 26, 2020

Federal Institutional Controls- ICs:

[FED INST](#)

Institutional controls are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Although it is EPA's (United States Environmental Protection Agency) expectation that treatment or engineering controls will be used to address principal threat wastes and that groundwater will be returned to its beneficial use whenever practicable, ICs play an important role in site remedies because they reduce exposure to contamination by limiting land or resource use and guide human behavior at a site.

Government Publication Date: Aug 26, 2020

Emergency Response Notification System:

[ERNS 1982 TO 1986](#)

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1982-1986

Emergency Response Notification System:

[ERNS 1987 TO 1989](#)

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories.

Government Publication Date: 1987-1989

Emergency Response Notification System:

[ERNS](#)

Database of oil and hazardous substances spill reports controlled by the National Response Center. The primary function of the National Response Center is to serve as the sole national point of contact for reporting oil, chemical, radiological, biological, and etiological discharges into the environment anywhere in the United States and its territories. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: May 19, 2020

The Assessment, Cleanup and Redevelopment Exchange System (ACRES) Brownfield Database:

[FED BROWNFIELDS](#)

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties protects the environment, reduces blight, and takes development pressures off greenspaces and working lands. This database is made available by the United States Environmental Protection Agency (EPA).

Government Publication Date: Sep 3, 2019

FEMA Underground Storage Tank Listing:

[FEMA UST](#)

The Federal Emergency Management Agency (FEMA) of the Department of Homeland Security maintains a list of FEMA owned underground storage tanks.

Government Publication Date: Dec 31, 2017

Petroleum Refineries:

[REFN](#)

List of petroleum refineries from the U.S. Energy Information Administration (EIA) Refinery Capacity Report. Includes operating and idle petroleum refineries (including new refineries under construction) and refineries shut down during the previous year located in the 50 States, the District of Columbia, Puerto Rico, the Virgin Islands, Guam, and other U.S. possessions. Survey locations adjusted using public data.

Government Publication Date: Jul 10, 2020

Petroleum Product and Crude Oil Rail Terminals:

[BULK TERMINAL](#)

List of petroleum product and crude oil rail terminals made available by the U.S. Energy Information Administration (EIA). Includes operable bulk petroleum product terminals located in the 50 States and the District of Columbia with a total bulk shell storage capacity of 50,000 barrels or more, and/or the ability to receive volumes from tanker, barge, or pipeline; also rail terminals handling the loading and unloading of crude oil that were active between 2017 and 2018. Petroleum product terminals comes from the EIA-815 Bulk Terminal and Blender Report, which includes working, shell in operation, and shell idle for several major product groupings. Survey locations adjusted using public data.

Government Publication Date: Apr 28, 2020

LIEN on Property:

[SEMS LIEN](#)

The EPA Superfund Enterprise Management System (SEMS) provides LIEN information on properties under the EPA Superfund Program.

Government Publication Date: Aug 26, 2020

Superfund Decision Documents:

[SUPERFUND ROD](#)

This database contains a listing of decision documents for Superfund sites. Decision documents serve to provide the reasoning for the choice of (or) changes to a Superfund Site cleanup plan. The decision documents include Records of Decision (ROD), ROD Amendments, Explanations of Significant Differences (ESD), along with other associated memos and files. This information is maintained and made available by the US EPA (Environmental Protection Agency).

Government Publication Date: Sep 22, 2020

State

Waste Site Cleanup Notifications/Reportable Releases:

[RELEASE](#)

This database contains information on all releases of oil and hazardous materials that have been reported to the Massachusetts Department of Environmental Protection (MassDEP).

Government Publication Date: Sep 8, 2020

Delisted Waste Site Cleanup Notification Sites:

[DELISTED REL](#)

List of sites which no longer appear on the Waste Site Cleanup Notifications Site List published by the Massachusetts Department of Environmental Protection (MassDEP). Sites no longer appear on the public site list when, after investigation, it is determined that the release was below reporting thresholds, or that the site is not classified as a 21E site.

Government Publication Date: Sep 8, 2020

Solid Waste Facilities:

[SWF/LF](#)

The Solid Waste Facility Master List provides information on landfills/dumping grounds, handling/transfer facilities, and combustion facilities. These solid waste operations in Massachusetts require site assignment and permitting by MassDEP's Bureau of Waste Prevention under 310 CMR 16.000 & 19.000.

Government Publication Date: Jan 14, 2020

Tank Related Leaks and Spills:

LST

Records of Tank Related Leaks and Spills made available by the Massachusetts Department of Environmental Protection (DEP). When a release occurs from a storage tank or system, the owner/operator must notify the DEP. This database contains a listing of releases and spills from tanks and/or tank systems both above and underground.

Government Publication Date: Sep 8, 2017

Leaking Underground Storage Tanks (LUST):

LUST

Sites that are within the Waste Site Cleanup Notifications/Reportable Releases Database that have a UST listed as source.

Government Publication Date: Sep 8, 2020

Leaking Aboveground Storage Tanks (LAST):

LAST

Sites that are within the Waste Site Cleanup Notifications/Reportable Releases Database that have a AST listed as source.

Government Publication Date: Sep 8, 2020

Delisted Leaking Storage Tanks:

DELISTED LST

This database contains a list of leaking storage tank sites that were removed from the Massachusetts Department of Environmental Protection (DEP) above and underground tank system.

Government Publication Date: Sep 8, 2020

Historic Leaking Underground Storage Tanks that occurred prior to October 1st 1993:

HIST LUST

List of leaking underground storage tank incidents from the Spills Database used by the Waste Site Cleanup program at the Massachusetts Department of Environmental Protection for spills that occurred prior to October 1, 1993. This information should be considered to be primarily of historical interest since all of the listed spills have either been cleaned up or assigned new tracking numbers and moved to the databases described above. Note that these files are considered a permanent version of the Spills Database and are unlikely to be updated.

Government Publication Date: Prior to Oct 1, 1993

Historic Leaking Aboveground Storage Tanks that occurred prior to October 1st 1993:

HIST LAST

List of leaking aboveground storage tank incidents from the Spills Database used by the Waste Site Cleanup program at the Massachusetts Department of Environmental Protection for spills that occurred prior to October 1, 1993. This information should be considered to be primarily of historical interest since all of the listed spills have either been cleaned up or assigned new tracking numbers and moved to the databases described above. Note that these files are considered a permanent version of the Spills Database and are unlikely to be updated.

Government Publication Date: Prior to Oct 1, 1993

Underground Storage Tanks (UST):

UST

The Underground Storage Tank (UST) Program is a major component of the Massachusetts groundwater resource protection effort. This is a listing of all underground storage tanks registered in Massachusetts.

Government Publication Date: Sep 30, 2020

Aboveground Storage Tanks:

AST

List of Aboveground Storage Tanks registered with the MA Department of Fire Services. Addresses provided by DFS are owner addresses, which may or may not coincide with the physical location of the tanks.

Government Publication Date: Aug 4, 2020

Delisted Storage Tanks:

DELISTED STORAGE TANK

This database contains a list of storage tank sites that were removed from the Massachusetts Department of Environmental Protection storage tank database.

Government Publication Date: Sep 30, 2020

Sites with Activity and Use Limitations:

AUL

The approximate location of oil or hazardous material release/disposal sites where an AUL has been filed. An AUL provides notice of the presence of oil and/or hazardous material contamination remaining at the location after a cleanup has been conducted pursuant to Chapter 21E and the MCP. The AUL is a legal document that identifies activities and uses of the property that may and may not occur, as well as the property owner's obligation and maintenance conditions that must be followed to ensure the safe use of the property. The complete AUL is filed at the County Registry of Deeds office for the respective City/Town.

Government Publication Date: Sep 8, 2020

Completed Brownfields Covenants:

BROWNFIELDS COV

List of sites with Completed Brownfields Covenants made available by the Massachusetts Department of Environmental Protection (MassDEP). Under Massachusetts law, M.G.L. c. 21E provides the Attorney General's Office with the authority to enter into Brownfields Covenant Not to Sue Agreements for brownfields sites not addressed by the automatic liability protections.

Government Publication Date: Jun 5, 2017

Massachusetts Brownfield Tracking:

BROWNFIELDS

List of reported releases at properties that meet the unofficial definition of a Brownfield site in Massachusetts, described as a real property whose redevelopment may be complicated by actual or perceived contamination by oil or hazardous materials. These properties are typically abandoned or for sale or lease and have been used for commercial or industrial purposes. Although the presence of contamination - or the fear of potential contamination - and the desire to redevelop/re-use a property is all it takes to be considered a candidate for brownfield incentives, a property's inclusion on this list does not automatically qualify it as a "Brownfield" site under other regulations, including Massachusetts Department of Energy Resources (DOER) regulations.

Government Publication Date: Dec 31, 2018

Tribal

Leaking Underground Storage Tanks (LUSTs) on Indian Lands:

INDIAN LUST

Leaking Underground Storage Tanks (LUSTs) in Region 1. There are no LUST records in Massachusetts at this time.

Government Publication Date: Oct 14, 2017

Underground Storage Tanks (USTs) on Indian Lands:

INDIAN UST

Underground Storage Tanks (USTs) on Tribal/Indian Lands in Region. There are no UST records in Massachusetts at this time.

Government Publication Date: Oct 14, 2017

Delisted Tribal Leaking Storage Tanks:

DELISTED ILST

Leaking Underground Storage Tank facilities which have been removed from the Regional Tribal LUST lists made available by the EPA.

Government Publication Date: Apr 14, 2020

Delisted Tribal Underground Storage Tanks:

DELISTED IUST

Underground Storage Tank facilities which have been removed from the Regional Tribal UST lists made available by the EPA.

Government Publication Date: Apr 14, 2020

County

No County standard environmental record sources available for this State.

Additional Environmental Record Sources

Federal

PFOA/PFOS Contaminated Sites:

PFAS NPL

List of sites where PFOA or PFOS contaminants have been found in drinking water or soil. Made available by the Federal Environmental Protection Agency (EPA).

Government Publication Date: Jul 7, 2020

Facility Registry Service/Facility Index:

FINDS/FRS

The Facility Registry Service (FRS) is a centrally managed database that identifies facilities, sites, or places subject to environmental regulations or of environmental interest. FRS creates high-quality, accurate, and authoritative facility identification records through rigorous verification and management procedures that incorporate information from program national systems, state master facility records, and data collected from EPA's Central Data Exchange registrations and data management personnel. This list is made available by the Environmental Protection Agency (US EPA).

Government Publication Date: Jun 15, 2020

Toxics Release Inventory (TRI) Program:

TRIS

The EPA's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of over 650 toxic chemicals from thousands of U.S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment. One of TRI's primary purposes is to inform communities about toxic chemical releases to the environment.

Government Publication Date: Feb 19, 2020

Perfluorinated Alkyl Substances (PFAS) Releases:

[PFAS TRI](#)

List of Toxics Release Inventory (TRI) facilities at which the reported chemical is a Per- or polyfluorinated alkyl substance (PFAS) included in the Environmental Protection Agency (EPA)'s consolidated PFAS Master List of PFAS Substances. The EPA's Toxics Release Inventory (TRI) is a database containing data on disposal or other releases of over 650 toxic chemicals from thousands of U.S. facilities and information about how facilities manage those chemicals through recycling, energy recovery, and treatment.

Government Publication Date: Feb 19, 2020

Perfluorinated Alkyl Substances (PFAS) Water Quality:

[PFAS WATER](#)

The Water Quality Portal (WQP) is a cooperative service sponsored by the United States Geological Survey (USGS), the Environmental Protection Agency (EPA), and the National Water Quality Monitoring Council (NWQMC). This listing includes records from the Water Quality Portal where the characteristic (environmental measurement) is in the Environmental Protection Agency (EPA)'s consolidated PFAS Master List of PFAS Substances.

Government Publication Date: Jul 20, 2020

Hazardous Materials Information Reporting System:

[HMIRS](#)

US DOT - Department of Transportation Pipeline and Hazardous Materials Safety Administration (PHMSA) Incidents Reports Database taken from Hazmat Intelligence Portal, U.S. Department of Transportation.

Government Publication Date: Jan 8, 2020

National Clandestine Drug Labs:

[NCDL](#)

The U.S. Department of Justice ("the Department") provides this data as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy.

Government Publication Date: Oct 5, 2020

Toxic Substances Control Act:

[TSCA](#)

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.

The CDR enables EPA to collect and publish information on the manufacturing, processing, and use of commercial chemical substances and mixtures (referred to hereafter as chemical substances) on the TSCA Chemical Substance Inventory (TSCA Inventory). This includes current information on chemical substance production volumes, manufacturing sites, and how the chemical substances are used. This information helps the Agency determine whether people or the environment are potentially exposed to reported chemical substances. EPA publishes submitted CDR data that is not Confidential Business Information (CBI).

Government Publication Date: Apr 11, 2019

Hist TSCA:

[HIST TSCA](#)

The Environmental Protection Agency (EPA) is amending the Toxic Substances Control Act (TSCA) section 8(a) Inventory Update Reporting (IUR) rule and changing its name to the Chemical Data Reporting (CDR) rule.

The 2006 IUR data summary report includes information about chemicals manufactured or imported in quantities of 25,000 pounds or more at a single site during calendar year 2005. In addition to the basic manufacturing information collected in previous reporting cycles, the 2006 cycle is the first time EPA collected information to characterize exposure during manufacturing, processing and use of organic chemicals. The 2006 cycle also is the first time manufacturers of inorganic chemicals were required to report basic manufacturing information.

Government Publication Date: Dec 31, 2006

FTTS Administrative Case Listing:

[FTTS ADMIN](#)

An administrative case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.

Government Publication Date: Jan 19, 2007

FTTS Inspection Case Listing:

[FTTS INSP](#)

An inspection case listing from the Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA) and Toxic Substances Control Act (TSCA), together known as FTTS. This database was obtained from the Environmental Protection Agency's (EPA) National Compliance Database (NCDB). The FTTS and NCDB was shut down in 2006.

Government Publication Date: Jan 19, 2007

Potentially Responsible Parties List:

PRP

Early in the cleanup process, the Environmental Protection Agency (EPA) conducts a search to find the potentially responsible parties (PRPs). EPA looks for evidence to determine liability by matching wastes found at the site with parties that may have contributed wastes to the site.

Government Publication Date: Jul 29, 2020

State Coalition for Remediation of Drycleaners Listing:

SCRD DRYCLEANER

The State Coalition for Remediation of Drycleaners (SCRD) was established in 1998, with support from the U.S. Environmental Protection Agency (EPA) Office of Superfund Remediation and Technology Innovation. Coalition members are states with mandated programs and funding for drycleaner site remediation. Current members are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.

Government Publication Date: Nov 08, 2017

Integrated Compliance Information System (ICIS):

ICIS

The Integrated Compliance Information System (ICIS) is a system that provides information for the Federal Enforcement and Compliance (FE&C) and the National Pollutant Discharge Elimination System (NPDES) programs. The FE&C component supports the Environmental Protection Agency's (EPA) Civil Enforcement and Compliance program activities. These activities include Compliance Assistance, Compliance Monitoring and Enforcement. The NPDES program supports tracking of NPDES permits, limits, discharge monitoring data and other program reports.

Government Publication Date: Nov 18, 2016

Drycleaner Facilities:

FED DRYCLEANERS

A list of drycleaner facilities from Enforcement and Compliance History Online (ECHO) online search. The Environmental Protection Agency (EPA) tracks facilities that possess NAIC and SIC codes that classify businesses as drycleaner establishments.

Government Publication Date: Jan 20, 2020

Delisted Drycleaner Facilities:

DELISTED FED DRY

List of sites removed from the list of Drycleaner Facilities (sites in the EPA's Integrated Compliance Information System (ICIS) with NAIC or SIC codes identifying the business as a drycleaner establishment).

Government Publication Date: Jan 20, 2020

Formerly Used Defense Sites:

FUDS

Formerly Used Defense Sites (FUDS) are properties that were formerly owned by, leased to, or otherwise possessed by and under the jurisdiction of the Secretary of Defense prior to October 1986, where the Department of Defense (DoD) is responsible for an environmental restoration. This list is published by the U.S. Army Corps of Engineers.

Government Publication Date: Jan 28, 2020

PHMSA Pipeline Safety Flagged Incidents:

PIPELINE INCIDENT

A list of flagged pipeline incidents made available by the U.S. Department of Transportation (US DOT) Pipeline and Hazardous Materials Safety Administration (PHMSA). PHMSA regulations require incident and accident reports for five different pipeline system types.

Government Publication Date: Jul 7, 2020

Material Licensing Tracking System (MLTS):

MLTS

A list of sites that store radioactive material subject to the Nuclear Regulatory Commission (NRC) licensing requirements. This list is maintained by the NRC. As of September 2016, the NRC no longer releases location information for sites. Site locations were last received in July 2016.

Government Publication Date: Aug 5, 2020

Historic Material Licensing Tracking System (MLTS) sites:

HIST MLTS

A historic list of sites that have inactive licenses and/or removed from the Material Licensing Tracking System (MLTS). In some cases, a site is removed from the MLTS when the state becomes an "Agreement State". An Agreement State is a State that has signed an agreement with the Nuclear Regulatory Commission (NRC) authorizing the State to regulate certain uses of radioactive materials within the State.

Government Publication Date: Jan 31, 2010

Mines Master Index File:

MINES

The Master Index File (MIF) contains mine identification numbers issued by the Department of Labor Mine Safety and Health Administration (MSHA) for mines active or opened since 1971. Note that addresses may or may not correspond with the physical location of the mine itself.

Government Publication Date: May 1, 2020

Alternative Fueling Stations:

[ALT FUELS](#)

List of alternative fueling stations made available by the US Department of Energy's Office of Energy Efficiency & Renewable Energy. Includes Biodiesel stations, Ethanol (E85) stations, Liquefied Petroleum Gas (Propane) stations, Ethanol (E85) stations, Natural Gas stations, Hydrogen stations, and Electric Vehicle Supply Equipment (EVSE). The National Renewable Energy Laboratory (NREL) obtains information about new stations from trade media, Clean Cities coordinators, a Submit New Station form on the Station Locator website, and through collaborating with infrastructure equipment and fuel providers, original equipment manufacturers (OEMs), and industry groups.

Government Publication Date: Sep 24, 2020

Registered Pesticide Establishments:

[SSTS](#)

List of active EPA-registered foreign and domestic pesticide-producing and device-producing establishments based on data from the Section Seven Tracking System (SSTS). The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) Section 7 requires that facilities producing pesticides, active ingredients, or devices be registered. The list of establishments is made available by the EPA.

Government Publication Date: Mar 31, 2020

Polychlorinated Biphenyl (PCB) Notifiers:

[PCB](#)

Facilities included in the national list of facilities that have notified the United States Environmental Protection Agency (EPA) of Polychlorinated Biphenyl (PCB) activities. Any company or person storing, transporting or disposing of PCBs or conducting PCB research and development must notify the EPA and receive an identification number.

Government Publication Date: Oct 9, 2019

State

Oil Spill Program:

[SPILLS](#)

The Massachusetts' Energy and Environmental Affairs' Department of Environmental Protection (DEP) manages The Bureau of Waste Site Cleanup and is responsible with ensuring immediate and effective response to environmental emergencies, such as oil spills, as well as timely assessment and cleanup of oil and hazardous waste disposal sites by parties responsible for them.

Government Publication Date: Nov 27, 2017

Historic Spills that occurred prior to October 1st 1993:

[HIS SPILLS](#)

List of spill incidents from the Spills Database used by the Waste Site Cleanup program at the Massachusetts Department of Environmental Protection for spills that occurred prior to October 1, 1993. This information should be considered to be primarily of historical interest since all of the listed spills have either been cleaned up or assigned new tracking numbers and moved to the databases described above. Note that these files are considered a permanent version of the Spills Database and are unlikely to be updated.

Government Publication Date: Prior to Oct 1, 1993

Per- and Polyfluoroalkyl Substances (PFAS):

[PFAS](#)

A list of releases reported to the Massachusetts Department of Environmental Protection (MassDEP) where the chemical is in the PFAS Master List of PFAS Substances made available by the Environmental Protection Agency (US EPA).

Government Publication Date: Sep 8, 2020

Tier Classified Oil and/or Hazardous Material Sites:

[OIL & HAZ MAT](#)

List of approximate locations of oil and/or hazardous material disposal sites that have been (1) reported and (2) Tier Classified under M.G.L. Chapter 21E and the Massachusetts Contingency Plan (MCP). This listing has been made available by Massachusetts Department of Environmental Protection (MassDEP).

Government Publication Date: Apr 6, 2020

Hazardous Waste and Waste Oil Generators:

[GEN](#)

List of permanent generator identification numbers for Massachusetts generators of hazardous waste and waste oil that have registered with or notified the Massachusetts Department of Environmental Protection (MassDEP) of their hazardous waste activities as defined in 310 CMR 30.00, the Massachusetts Hazardous Waste Regulations.

Government Publication Date: Sep 25, 2020

Asbestos Projects:

[ASBESTOS PROJECT](#)

A list of asbestos projects made available by the Massachusetts Department of Environmental Protection (MassDEP). Includes asbestos notifications for any project involving asbestos abatement, removal, or disposal, and construction and demolition (C&D) notifications for any C&D project, except in a residential building with fewer than 20 units.

Government Publication Date: Sep 9, 2020

Tribal

No Tribal additional environmental record sources available for this State.

County

No County additional environmental record sources available for this State.

Definitions

Database Descriptions: This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

Detail Report: This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

Distance: The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

Direction: The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

Elevation: The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

Executive Summary: This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

Map Key: The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

Unplottables: These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

APPENDIX C

Pre-characterization Sampling Locations

Summary of Properties of Concern
MBTA ROW
Transmission Line Project
Sudbury to Hudson, Massachusetts

	Active MassDEP Disposal Site
	MassDEP Disposal Site: Regulatory Closure Achieved
	Other Environmental Concerns Identified During Assessment

The table above is a summary of disposal sites where a documented release of oil and/or hazardous materials has been reported. The information is taken from the MassDEP Bureau of Waste Site Cleanup online database and may be subject to inaccuracies. Other environmental concerns such as nearby underground storage tanks, environmentally-sensitive industries (gas stations, drycleaners, automotive repair), hazardous waste generators, etc. may have the potential to impact the Project. In addition, the Project is located partially within a former railroad right-of-way, which are typically sources of oil and/or hazardous materials due to pesticide application associated with vegetation management, train exhaust, non-native fill used to bring tracks to grade, and other vehicle releases.

Re: **Geotechnical Report**
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836

Dear Ms. Cornell:

Lahlaf Geotechnical Consulting, Inc. (LGCI) has completed a geotechnical study for the proposed Transmission Power Line Borings in Sudbury, Massachusetts. We are submitting this report electronically, please notify us if you need a hard copy.

The soil samples from our explorations are currently stored at LGCI for further analysis, if requested. Unless notified otherwise, we will dispose of the soil samples after three months.

Thank you for choosing LGCI as your geotechnical engineer.

Very truly yours,

Lahlaf Geotechnical Consulting, Inc.

Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

1. PROJECT INFORMATION

1.1 Project Authorization

This report presents the results of subsurface explorations and a geotechnical evaluation performed by Lahlaf Geotechnical Consulting, Inc. (LGCI) for the proposed transmission power line in Sudbury, Massachusetts. We performed our services in general accordance with our proposal No. 16006-Rev. 3 dated January 23, 2016 and revised June 19, 2018.

1.2 Purpose and Scope of Services

The purpose of this geotechnical study was to obtain subsurface information at the site and to provide foundation design and construction recommendations for the utility vaults along the proposed transmission power line. LGCI performed the following services:

- Provided a geotechnical senior and field engineer to attend a site meeting with VHB representatives and the drilling subcontractor's crew on May 22, 2018.
- Provided a geotechnical field engineer at the site. The engineer coordinated and observed the borings, described the soil samples, and prepared field logs.
- Submitted six (6) stream bed samples for laboratory testing.
- Performed one (1) borehole permeability test.
- Prepared this geotechnical report containing the results of our subsurface explorations and our recommendations for foundation design and construction related to the proposed transmission power line.

A report presenting the results of our geotechnical services for the Hudson portion of this project was submitted on August 16, 2018. That report was reviewed and comments from Vanasse Hangen Brustlin, Inc. (VHB) were addressed in a revised report submitted on September 14, 2018.

This report presents the results of our geotechnical services for the Sudbury portion of this project.

Our scope did not include attending meetings, preparing specifications, reviewing contract documents and shop drawings, or providing construction services. LGCI would be pleased to perform these services when needed. Recommendations for stormwater management, erosion control, pavement design, subgrade preparation for roadways and other paved areas, slope stability analyses, and detailed cost or quantity estimates are not included in our scope of work.

**Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

Our scope does not include performing environmental services for this project. LGCI did not perform an environmental assessment to evaluate the presence or absence of wetlands or analytical testing for hazardous or toxic materials in the soil, surface water, groundwater, or air, on or below this site, or mold in the soil or any structure at this site. Any statement about the color, odor, or the presence of suspicious materials included in our boring logs or report were made by LGCI for information only and to support our geotechnical services. No environmental recommendations and/or opinions are included in this report.

1.3 Site Description

Our understanding of the existing conditions is based on field observations, our discussions with VHB, and on the following drawing:

- “Proposed Conditions Plans for Notice of Intent Submittal, Sudbury-Hudson Transmission Reliability Project, Sudbury, Massachusetts,” (NOI Plans) prepared by VHB and dated February 5, 2018.

The site extends along an abandoned Massachusetts Bay Transit Authority (MBTA) railroad. The abandoned railroad extends along the MBTA right-of-way (ROW) through the town of Sudbury. Sections of the abandoned railroad tracks are built on an embankment, other sections are below the surrounding ground surface, and a few sections are at grade with the surrounding ground surface. The embankment is typically about 2 to 6 feet high, 10 feet to 25 feet wide at the top, and 30 to 40 feet wide at the bottom. In a few areas, the sides of the embankment are part of a slope that is up to about 20 feet tall and continues out beyond the MBTA ROW. The sections of the abandoned railroad tracks below the surrounding ground surface were between about 2 feet and 6 feet below the surrounding ground surface.

The abandoned railroad extends through wooded areas and wetlands. The abandoned railroad crosses the Hop Brook over an existing steel bridge. Private properties border the MBTA ROW on either side. The railroad intersects with Dutton Road, Horse Pond Road, Union Avenue, Boston Post Road, and Landham Road. Figure 1 shows the approximate extent of the project site.

The ground surface elevations of this portion of the project range between El. 200 on the western side and El. 135 on the eastern side, with a local low of El. 124 near the easternmost crossing of Hop Brook.

1.4 Project Description

Our understanding of the proposed transmission power line is based on our discussions with VHB, the NOI Plans listed in Section 1.3, and the following drawings:

**Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

- “Line 1151 South End Glenbrook, 115-kV Underground Transmission Line, Splice Vault Detail, Stamford, Connecticut,” prepared by Northeast Utilities Service Co. and dated May 10, 2013.
- “Cross Sections, Sudbury Hudson Transmission Line Reliability Project, Hudson, Stow, Marlborough, & Sudbury, Massachusetts,” (Cross Sections) prepared by VHB for Eversource Energy and dated July 2, 2018.
- “Typical Sections, Sudbury Hudson Transmission Line Reliability Project, Hudson, Stow, Marlborough, & Sudbury, Massachusetts,” (Typical Sections) prepared by VHB for Eversource Energy and dated July 2, 2018.

We understand that Eversource Energy (Eversource) engaged VHB to coordinate and observe a subsurface exploration for its proposed transmission power line. The transmission power line will be a 115-kV underground transmission power line connecting a substation in Hudson to a substation in Sudbury and will extend along a proposed bike path that will be constructed along the abandoned railroad bed.

We understand that the construction of the proposed transmission power line will include twenty-eight (28) vaults, three (3) bridges, and two (2) retaining walls as follows:

- Fourteen (14) vaults in Hudson and fourteen (14) vaults in Sudbury;
- Two (2) bridges (Chestnut Street Bridge and Fort Meadow Brook Bridge) in Hudson, and one (1) bridge (Hop Brook Bridge No. 127) in Sudbury.
- One (1) retaining wall in Hudson and Stow and one (1) retaining wall in Sudbury.

This report focuses on the portion of the proposed transmission power line in Sudbury. Recommendations for the portion of the line in Hudson and Stow were contained in a separate report listed in Section 1.2.

The Sudbury portion of the transmission power line extends approximately 4.5 miles. The proposed transmission power line will be installed within a trench that will generally extend to depths of about 5 feet beneath the ground surface. We understand that the proposed transmission power line will be encased in concrete.

We understand that the proposed vaults will be spaced 1,500 to 1,900 feet apart. We also understand that the proposed vaults will have a length of 24 feet, a width of 8 feet, and a height of 8 feet. VHB indicated to us that the vaults will likely have a wall thickness of 6 inches. The vaults will be designed with two (2) 3-foot manholes per vault. The vaults are generally placed at a depth of 11 feet. This is to provide 2 feet between the top of the vault and the proposed finished grade for manhole brick work.

Based on the Cross Sections, the proposed retaining wall will extend from about Sta. 724+00 to Sta. 735+00, i.e., and will be about 1100 feet long. The current design includes sheet piles for

**Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

the proposed wall with a concrete cap on top. Information about the height of the proposed retaining wall was not available at the time of this report.

1.5 Elevation Datum

We understand that elevations shown in the NOI Plans are referenced with respect to the North American Vertical Datum (NAVD) of 1988 and are in feet.

2. SITE AND SUBSURFACE CONDITIONS

2.1 Surficial Geology

LGCI reviewed the surficial geological map titled: “Surficial Geologic Map of the Clinton-Concord-Grafton-Medfield 12-Quadrangle Area in East Central Massachusetts,” compiled by Bryon D. Stone and Janet R. Stone for U.S. Geological Survey, Open-File report (2006).

The geologic map indicates that a variety of surficial deposits exist along the alignment of the proposed power line. The deposits covering the most area, as shown on the geologic map, are coarse deposits consisting of a mixture of gravel- and sand-sized material. The deposits covering the next largest area shown on the geologic map are fine deposits consisting of very fine sand, silt, and clay occurring in well sorted layers. Also present in the general vicinity of the site, are swamp deposits, till, floodplain alluvium, artificial fill, and bedrock outcrops. The surficial geologic maps of the site are shown in Figures 2A and 2B.

2.2 LGCI’s Borings

VHB engaged Geosearch, Inc. (Geosearch) of Sterling, Massachusetts to advance forty (40) borings for the Sudbury portion of the project between September 5 and November 14, 2018 as follows:

- Two (2) borings (B-BB-5 and B-BB-6) for the proposed bridge, the results of which are included in a separate report;
- Five (5) borings (B-GB-17 to B-GB-21) for the proposed retaining wall; and
- Thirty-three (33) borings, B-28 to B-42, B-51, B-GB-1 to B-GB-3, B-GB-5, and B-MP-27 to B-MP-39, for the proposed transmission power line.

The bridge borings, B-BB-5 and B-BB-6, extended to depths of 54 and 51 feet beneath the ground surface respectively. The retaining wall borings, B-GB-17 to B-GB-21, extended  depths ranging between 20 and 23 feet beneath the ground surface. The power line borings, B-28 to B-42, B-51, B-GB-1 to B-GB-3, B-GB-5, and B-MP-27 to B-MP-39, extended to depths ranging between 2.5 and 17 feet beneath the ground surface. An LGCI engineer observed and logged the borings in the field. A representative from VHB was on site to collect soil samples from the borings along the proposed transmission power line for laboratory testing, including thermal resistivity, oil and/or hazardous materials, proctor, and grain-size analysis. The results of the tests performed by VHB are not included in our report.

The borings were advanced in grass areas along the abandoned MBTA railroad and were advanced with a CME 55 LC rubber track ATV rig by employing 4 ¼-inch hollow stem augers, except for the bridge borings, B-BB-5 and B-BB-6, which were advanced with a 3- and 4-inch casing using drive and wash techniques. Boring B-39, where a borehole permeability test was performed, was also advanced with a 3-inch casing using drive and wash techniques.

**Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

The drillers performed Standard Penetration Tests (SPT) and obtained split spoon samples with an automatic hammer typically at depth intervals of 2 feet or 5 feet, as noted on the boring logs, in general accordance with ASTM D-1586. We understand that the samples will be transmitted to VHB. Unless notified otherwise, we will dispose of the soil samples after three months.

Figures 3A to 3Z, and 3AA to 3AC show the boring locations, and Appendix A contains LGCI's boring logs. The ground surface elevations noted on the boring logs were interpolated to the nearest foot from the NOI Plans.

2.3 Subsurface Conditions

2.3.1 General

The subsurface description in this report is based on a limited number of borings and is intended to highlight the major soil strata encountered during our borings. The subsurface conditions are known only at the actual boring locations. Variations may occur and should be expected between boring locations. The boring logs represent conditions that we observed at the time of our explorations and were edited, as appropriate, based on inspection of the soil samples in the laboratory. The strata boundaries shown in our boring logs are based on our interpretations and the actual transition may be gradual. Graphic soil symbols are for illustration only.

Our subsurface descriptions were broken down into two sections: proposed transmission power line borings and retaining wall borings.

2.3.2 Proposed Transmission Power Line Borings

This section describes the subsurface conditions encountered in the borings along or near the alignment of the proposed transmission power line, including borings B-28 to B-42, B-51, B-GB-1 to B-GB-3, B-GB-5, and B-MP-27 to B-MP-39.

The soil strata encountered in the borings were as follows, starting at the ground surface:

Surficial Organic Soil – A surficial layer of forest mat and organic topsoil was encountered in borings B-28 to B-34, B-37 to B-39, B-41 to B-42, B-MP-27 to B-MP-39, and B-GB-5. This layer generally consisted of silty sand with organic fines, roots, leaves, grass, and wood. This layer had a thickness ranging between 0.1 and 2 feet but was generally less than 0.5 feet thick.

Fill – A layer of fill was encountered underneath the surficial organic layer, except in borings B-30 to B-32, and B-MP-27 to B-MP-29. The fill extended to depths ranging up to 11 feet. Borings B-37, B-38, and B-MP-37 terminated in the fill at depths of 10, 16, and 10 feet, beneath the ground surface, respectively.

**Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

The fill was mostly described as silty sand and less frequently as poorly graded sand or well graded sand. There were three (3) samples in boring B-MP-34 that were described as silty gravel or poorly graded gravel. One (1) sample in boring B-51 was described as silt. The fines content in the fill ranged up to 45 percent, but generally ranged between 5 and 30 percent. The gravel content in the fill ranged up to 40 percent, but generally ranged between 5 and 15 percent. The fill contained traces of organic fines, coal ash, roots, coal, and wood.

The Standard Penetration Test (SPT) N-values in this layer ranged between 3 and greater than 120 blows per foot (bpf), with most values lower than 20 bpf indicating very loose to medium dense material.

Buried Organic Soil and Swamp Deposits – A layer of buried organic soil and swamp deposits was encountered beneath the fill in borings B-GB-5, B-GB-18, B-GB-20, B-MP-32, B-MP-36 and extended to depths of up to 11.1 feet beneath the ground surface. The buried organics contained fibrous peat, organic fines, and roots.

Sand – A layer of sand was encountered beneath the surficial organic soil, fill, or buried organic soil in all the borings and extended to the boring termination depths except in borings B-36, B-37, B-38, and B-MP-37. The sand layer was mostly described as silty sand and less frequently as poorly graded sand. The sand layer also contained samples described as well graded sand, silty gravel, and silt. The fines content in the sand ranged up to 45 percent, but generally ranged between 5 and 35 percent. The gravel content in the sand ranged up to 35 percent, but generally ranged between 5 and 15 percent.

The SPT N-values in the sand ranged between 6 and greater than 120 bpf, with most values between 10 and 50 bpf indicating medium dense to dense sand.

Bedrock – Bedrock was confirmed by using coring techniques in boring B-36. The top of the bedrock was at a depth of 6.0 feet beneath the ground surface. The bedrock was described as hard, slightly weathered, slightly fractured, fine-grained, gray with black mottles Granite. The rock recovery values ranged between 61.1 and 87.5 percent and the rock quality designation (RQD) values ranged between 72.7 and 85.7 percent.

2.3.3 Proposed Retaining Wall Borings

This section describes the subsurface conditions encountered in the borings along or near the alignment of the proposed retaining wall, including borings B-GB-17 to B-GB-21.

The soil strata encountered within the borings were as follows, starting at the ground surface:

Forest Mat – A layer of forest mat was encountered at the ground surface of all five (5) borings. The forest mat thickness ranged between 1 and 4 inches.

**Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

Fill – A layer of fill was encountered beneath the forest mat in all the borings advanced along or near the alignment of the proposed retaining wall. The fill extended to depths ranging between 6.4 and 12.0 feet beneath the ground surface. The fill was mostly described as silty sand. One (1) sample was described as well graded sand with silt and one (1) sample was described as silt. The fines content in the fill ranged between 5 and 35 percent. The gravel content in the fill ranged between 5 and 30 percent. The fill contained traces of angular stone fragments, organic fines, coal ash, coal, and roots.

The SPT N-values of the fill ranged between 5 and 106 bpf, with most values lower than 24 bpf, indicating loose to medium dense material. The relatively high SPT N-Values recorded in the fill may be caused by cobbles and boulders in the fill and may not represent the true density.

Swamp Deposits – A layer of swamp deposits was encountered beneath the fill in borings B-GB-18 and B-GB-20. The buried organics extended to depths ranging between 10 and 11.1 feet beneath the ground surface. The buried organics consisted of silty sand with traces of organic fines, peat fibers, and roots. Two (2) samples from boring B-GB-18 were described as organic silt.

Sand – A layer of sand was encountered beneath the fill or buried organics in all borings advanced near the alignment of the proposed retaining wall. The sand layer extended to the termination depth of the borings except in boring B-GB-20. The sand was mostly described as silty sand. Two (2) samples were described as well graded sand with silt, two (2) samples were described as silt, and one (1) sample was described as silty gravel. The fines content in the sand ranged between 15 percent and 45 percent. The gravel content in the sand ranged between 15 and 40.

The SPT N-values in the sand ranged between 4 and over 120 bpf, with most values between 14 and 50 bpf, indicating mostly medium dense to dense sand.

Bedrock – Bedrock was confirmed by using coring techniques in boring B-GB-20. The top of the bedrock was at a depth of 18.0 feet beneath the ground surface. The bedrock was described as hard, slightly weathered, slightly fractured, fine-grained, gray with white and green mottles Granite. The rock recovery value was 100 percent and the RQD value was 85 percent.

2.4 Groundwater

2.4.1 General

The groundwater data obtained during drilling and reported in this report is based on observations made during or shortly after completion of our explorations and may not represent the actual groundwater levels, as additional time may be required for the

groundwater to stabilize. The groundwater levels presented in this report only represent the conditions encountered at the time and location of our explorations. Seasonal fluctuation should be anticipated.

Please note that our groundwater measurements were performed during the period between September and November 2018. Seasonal fluctuation should be anticipated. The groundwater levels are anticipated to be higher during the months of the wet season in early spring.

2.4.2 Proposed Transmission Power Line

Groundwater was encountered in all the borings advanced along or near the alignment of the proposed transmission power line, except in borings B-32, B-34, B-35, B-37, B-GB-1 to B-GB-3 and B-MP-28. Groundwater was encountered at depths of up to 15 feet beneath the ground surface, but generally ranged between 4 and 10 feet beneath ground surface.

2.4.3 Proposed Retaining Wall

Groundwater was encountered in all the borings along or near the alignment of the proposed retaining wall at depths of up to 6.8 feet beneath the ground surface, but generally ranged between 3.5 and 6.0 feet beneath ground surface.

2.5 Borehole Permeability Tests

LGCI performed one (1) falling head borehole permeability test in boring B-39. The test was performed by filling the drill casing with water and measuring the drop in water level inside the casing. The test was performed at a depth range of 12 feet to 14 feet below ground surface.

The results of the borehole permeability test is included in Appendix C. The results indicate that permeability of the soil at a depth of 12 to 14 feet in boring B-39 is about 2.7×10^{-4} cm/sec.

2.6 Laboratory Test Data

LGCI submitted six (6) stream bed samples from Hop Brook near the northern and southern sides of the existing steel bridge. The stream bed samples were obtained either in the middle of the stream or near the shore, and approximately 5 to 10 inches underwater. The results are summarized in the table below. The laboratory data sheets are included in Appendix B.

Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts

3. EVALUATION AND RECOMMENDATIONS

3.1 General

Based on our understanding of the proposed transmission power line, our observation of the borings, and the results of our laboratory testing, there are a few issues that we would like to highlight for consideration and discussion.

- Buried organic soil was encountered in many borings. The depth to the bottom of the organic soil was generally less than 10 feet. The proposed vaults should be supported on Structural Fill placed directly on top of the natural sand. Our recommendations for bearing resistance for the proposed vaults are presented in Section 3.2.
- The sheet pile retaining wall is well suited for the subsurface conditions encountered in our borings, as it will not require the removal of the existing fill and the buried organic soil. The presence of the organic soil may result in longer sheet piles. Also, fill placed to raise the grades near the proposed retaining wall will result in settlement induced by the compression of the buried organic soil. This settlement will not affect the proposed vaults, transmission power lines, or sheet pile retaining wall. The contractor should be prepared to pre-trench to remove boulders at locations where boulders are encountered ahead of the sheet pile driving operations.
- The subsurface conditions encountered in our borings are in general suitable to support the proposed duct bank encasement of the proposed transmission power line as the trench for the proposed transmission power line will terminate in existing fill or natural soil. In a few locations, the proposed transmission power line trench will terminate in the organic soil or at the bottom of the existing fill, just above the organic soil. At these locations, we recommend over-excavating the organic soil and backfilling the trench to the bottom of the proposed transmission power line using suitable backfill. Where the organic soil is more than 2 feet from the bottom of the proposed transmission power line trench, the organic soil should not be removed. Additional recommendations for supporting the proposed transmission power line are presented in Section 4.1.
- Drill chattering was observed in several borings along the MBTA railroad. The contractor should be prepared to encounter boulders during excavation and should be prepared to remove the boulders from the site including possibly performing pre-trenching for the sheet piles.
- Rock was encountered in one of the proposed wall borings, B-GB-20 at a depth of 18 feet beneath the ground surface. We do not anticipate that the depth to rock will interfere with the proposed sheet pile walls, unless the proposed wall has heights such that the required embedment is more than 18 feet. Rock was also encountered in boring B-36. The excavation for the proposed vault and power line trench will require rock excavation at this location.

**Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

- The existing fill along the MBTA railroad contained varying amounts of organic matter and coal. Due to the presence of coal ash, these materials will have to be pre-characterized before disposal offsite. To reduce the quantity of material to be disposed of offsite, the contractor should be prepared to segregate the inorganic portion of the existing fill and amend it as needed to improve its gradation for reuse as backfill. Our recommendations for fill materials and for reuse of onsite materials are presented in Sections 4.3 and 4.4, respectively.
- We anticipate that groundwater control will be required to construct the proposed vaults. The design and the construction sequence should be performed so as to allow for the construction of the proposed vaults in a dry excavation and to reduce the potential for uplift of the vault at the end of dewatering operations. Groundwater control will also be required along portions of the transmission power line trenches. Our recommendations for groundwater control are presented in Section 4.7.
- Foundations should be designed in accordance with the requirements of the Massachusetts State Building Code, Ninth Edition (MSBC 9th edition).

3.2 Vault Recommendations

- We recommend supporting the proposed vaults on a minimum of 12 inches of Structural Fill bearing on natural sand. In areas where the proposed transmission power line trench terminates in the buried organic soil or less than 2 feet from the top of the organic soil, the organic soil should be removed at least 2 feet beneath the bottom of the trench or to the natural sand, whichever occurs first.
- We recommend an allowable bearing pressure of 3 kips per square foot (ksf) for vaults bearing on natural sand.
- The vaults should be designed with slabs and walls thick enough such that the weight of the vault resists uplift pressure. We recommend a minimum factor of safety of 1.1 against uplift.
- We recommend that the vault walls be designed using at-rest pressure and to resist the hydrostatic pressure as described in section 3.4.

3.3 Seismic Design

In accordance with Section 1613 of MSBC 9th Edition, the seismic criteria for the site are as follows:

**Geotechnical Report
Proposed Transmission Power Line Borings
Sudbury, Massachusetts
LGCI Project No. 1836**

Site Class:	D
Spectral Response Acceleration at short period (S_S):	0.203g
Spectral Response Acceleration at 1 sec. (S_1):	0.069g
Site Coefficient F_a (Table 1613.2.3(1)):	1.6
Site Coefficient F_v (Table 1613.2.3(2)):	2.4
Adjusted spectral response S_{MS} :	0.325 g
Adjusted spectral responses S_{M1} :	0.166g

Based on our observations of the borings, the natural soil layer at the site is not susceptible to liquefaction during a seismic event.

3.4 Lateral Pressures for Wall Design

Lateral earth pressures recommended for design of the proposed retaining wall and vault walls are provided in the section below.

We recommend using the following values for retaining wall design:

Coefficient of Active Earth Pressure, K_A :	0.31
Coefficient of Active Earth Pressure, K_P in Top 5 feet	2.0
Coefficient of Active Earth Pressure, K_P at depths greater than 5 feet:	4.1
Coefficient of At-Rest Earth Pressure, K_o :	0.50
Friction Angle between Backfill and Back of Wall, δ :	10 degrees
Total Unit Weight, γ :	120 pcf
Buoyant Unit Weight γ' :	57.4 pcf

Note: The coefficient of active pressure value is based on Coulomb's equation using an internal friction angle for the backfill, ϕ , of 30 degrees and a friction angle between the backfill and the structure, δ , of 10 degrees. The coefficients of active and at-rest earth pressure are provided for wall backfill with a horizontal surface (non-sloping backfill) on the active side for the retaining wall. The coefficient of passive earth pressure is provided for a sloping ground with a slope of 3H:1V in the top 5 feet.

- The proposed vault walls should be designed using the “at-rest” pressure coefficient.
- The length of the proposed sheet pile wall obtained using the design parameters recommended above should be increased by the thickness of the buried topsoil.
- We recommend placing free-draining material consisting of Structural Fill or crushed stone within the 3 feet immediately behind retaining walls. The sheet pile wall should be provided with weep hole near the bottom of the wall to promote drainage.
- The design of the sheet pile wall should include a traffic surcharge equivalent to 200 pounds per square foot.

3.5 Seismic Pressure

In accordance with the MSBC 9th Edition, Section 1610, a lateral earthquake force equal to $0.100 \cdot (S_s) \cdot (F_a) \cdot \gamma \cdot H^2$ should be included in the design of walls (for horizontal backfill), where S_s is the maximum considered earthquake spectral response acceleration (defined in Section 3.3), F_a is the site coefficient (defined in Section 3.3), γ is the total unit weight of the soil backfill, and H is the height of the wall.

The earthquake force should be distributed as an inverted triangle over the height of the wall. In accordance with MSBC 9th Edition, Section 1610.2, a load factor of 1.43 shall be applied to the earthquake force for wall strength design.

Temporary surcharges should not be included when designing for earthquake loads. Surcharge loads applied for extended periods of time shall be included in the total static lateral soil pressure and their earthquake lateral force shall be computed and added to the force determined above.

4. CONSTRUCTION CONSIDERATIONS

4.1 Subgrade Preparation

- Existing fill, organic soil, abandoned utilities, and other below-ground structures should be entirely removed from within an area extending at least 2 feet beyond the limits of the proposed vaults.
- The proposed vault excavations should extend to 12 inches below the proposed bottom of vaults. Should existing fill, organic soil, or other deleterious material be present at these depths, it should be removed and replaced with compacted Structural Fill to the top of the natural sand or 2 feet beneath the bottom of the proposed vault, whichever occurs first.
- The subgrade of the vaults in the natural sand, should be compacted with a dynamic vibratory compactor imparting a minimum of 10 kips of force to the subgrade.
- Should boulders be encountered at the vault subgrade, the boulders should be removed, and the resulting excavation should be backfilled with compacted Structural Fill meeting the gradation requirements in Section 4.3.
- Loose or soft soils identified during the compaction of the foundation subgrades that cannot be compacted in place should be excavated to a suitable bearing stratum as determined by the representative of LGCI. Grades should be restored by backfilling with Structural Fill.
- When crushed stone is required in the drawings or it is used for the convenience of the contractor, it should be wrapped in a geotextile fabric for separation except where introduction of the geotextile promotes sliding. A geotextile should not be placed between the bottoms of the foundations and crushed stone.
- The proposed transmission power line trench should extend to at least 12 inches beneath the bottom of the transmission power line. Where the excavation terminates in organic soil or less than 2 feet from the top of the organic soil, the excavation should be continued to the natural sand layer or 2 feet beneath the bottom of the transmission power line, whichever occurs first. The over-excavation should be backfilled with Ordinary Fill meeting the gradation requirements in Section 4.3.
- An LGCI representative should observe the exposed foundation subgrades prior to fill and concrete placement to verify that the exposed bearing materials are suitable for the design soil bearing pressure. If soft or loose pockets are encountered in the foundation excavations, the soft or loose materials that cannot be compacted in place should be removed, and the bottom of the foundation should be placed at a lower elevation on firm soil, or the resulting excavation should be backfilled with Gravel Borrow, or crushed stone wrapped in a filter fabric.

4.2 Subgrade Protection

The onsite natural sand is frost susceptible. If construction takes place during freezing weather, special measures should be taken to prevent the subgrade from freezing. Such measures should include the use of heat blankets or excavating the final six inches of soil just before pouring concrete. Soil used as backfill should be free of frozen material, as should the ground on which it is placed. Filling operations should be halted during freezing weather.

Materials with high fines content are typically difficult to handle when wet as they are sensitive to moisture content variations. Subgrade support capacities may deteriorate when such soils become wet and/or disturbed. The contractor should keep exposed subgrades properly drained and free of ponded water. Subgrades should be protected from machine and foot traffic to reduce disturbance.

4.3 Fill Materials

Structural Fill and Ordinary Fill should consist of inert, hard, durable sand and gravel, free from organic matter, clay, surface coatings and deleterious materials, and should conform to the gradation requirements shown below.

4.3.1 Structural Fill

The Structural Fill should have a plasticity index of less than 6 and should meet the gradation requirements shown below. Structural Fill should be compacted in maximum 9-inch loose lifts to at least 95 percent of the Modified Proctor maximum dry density (ASTM D1557), with moisture contents within ± 2 percentage points of optimum moisture content.

Sieve Size	Percent Passing by Weight
3 inches	100
1 ½ inch	80 - 100
½ inch	50 - 100
No. 4	30 - 85
No. 20	15 - 60
No. 60	5 - 35
No. 200*	0 - 10

4.3.2 Ordinary Fill

Ordinary Fill should have a plasticity index of less than 6 and should meet the gradation requirements shown below. Ordinary Fill should be compacted in maximum 9-inch loose lifts to at least 95 percent of the Modified Proctor maximum dry density (ASTM D1557), with moisture contents within ± 2 percentage points of optimum moisture content.

Sieve Size	Percent Passing by Weight
6 inches	100
1 inch	50 - 100
No. 4	20 - 100
No. 20	10 - 70
No. 60	5 - 45
No. 200	0 - 20

4.4 Reuse of Onsite Materials

Based on our field observations and the results of the grain-size analyses, we do not anticipate that the site soils will meet the gradation requirements of Structural Fill. Some of the existing fill meets the gradation requirements of Ordinary Fill. Some of the poorly graded sand that could be reused as Ordinary Fill may become difficult to compact, due to the fines content, when exposed to moisture and should be kept under strict moisture control.

Should the contractor encounter materials potentially suitable for reuse during earthwork operations, the contractor should avoid mixing the reusable soils with unsuitable soils. The soils to be reused should be excavated and stockpiled separately for compliance testing. The contractor should be prepared to amend the existing fill free of organics to meet the gradation requirements for Ordinary Fill for reuse as trench backfill.

Soils with 20 percent or greater fines content are generally very sensitive to moisture content variations and are susceptible to frost. Such soils are very difficult to compact at moisture contents that are much higher or much lower than the optimum moisture content determined from the laboratory compaction test. Therefore, strict moisture control should be implemented during compaction of onsite soils with fines contents of 20 percent or greater. The contractor should be prepared to remove and replace such soils if pumping occurs.

4.5 Contractor Submittals

The contractor should submit details about the construction procedures, including:

- The proposed construction sequence;
- Temporary earth support system for the proposed vaults if any; and
- Groundwater control system.

Contractor submittals should be prepared and sealed by a professional engineer registered in the Commonwealth of Massachusetts and should be submitted for review at least two weeks before the start of the work.

4.6 Temporary Excavations

All excavations to receive human traffic should be constructed in accordance with the OSHA guidelines.

The site soils should generally be considered Type “C” and should have a maximum allowable slope of 1.5 Horizontal to 1 Vertical (1.5H:1V) for excavations less than 20 feet deep. Deeper excavations, if needed, should have shoring designed by a professional engineer.

The contractor is solely responsible for designing and constructing stable, temporary excavations and should shore, slope, or bench the sides of the excavations as required to maintain stability of the excavation sides and bottom.

4.7 Groundwater Control Procedures and Flow Rate Estimates

4.7.1 General

We anticipate that groundwater control procedures will be needed during the excavation for the proposed vaults to handle the groundwater. We recommend that the contractor design and submit a plan to collect and remove groundwater prior to the start of the excavations. Such a plan should include, at a minimum, multiple sump pump pits extending at least 3 feet beneath the bottom of the excavation.

Groundwater levels should be maintained at a minimum of 1-foot below the bottom of excavations during construction. The contractor should be permitted to employ whatever commonly accepted means and practices are available to dewater.

To reduce the potential for sinkholes developing over sump pump pits after the sump pumps are removed, the crushed stone placed in the sump pump pits should be wrapped in a geotextile fabric. Alternatively, the crushed stone should be entirely removed after the sump pump is no longer in use and the sump pump pit should be restored with suitable backfill.

Groundwater collected from excavations should be filtered for fines in sedimentation basins before being discharged. At a minimum, the sedimentation basins should be constructed of hay bales wrapped in a geotextile fabric.

The contractor should discharge groundwater from the dewatering system in accordance with permits and local and state regulations.

4.7.2 Flow Rate Estimates

We estimated the anticipated quantity of flow in the proposed vault excavations and the proposed utility trench. We assumed a groundwater depth of 3 feet, vault excavation dimensions of 30 feet by 10 feet with an excavation depth of 12 feet, and a utility trench depth of 6 feet.

Using the coefficient of permeability values listed in Section 2.5, we estimate a quantity of flow ranging between 1,000 and 4,000 gal/day for the proposed vaults and between 10 and 30 gal/day per foot of excavation for the proposed transmission line.

5. RECOMMENDATIONS FOR FUTURE WORK

We recommend engaging LGCI to perform the following services:

- Assist VHB during the design of the proposed sheet pile retaining wall.
- Review the geotechnical aspects of contractor submittals.
- Provide a field representative to observe the subgrades of foundations during construction.

6. REPORT LIMITATIONS

Our analysis and recommendations are based on project information provided to us at the time of this report. If changes to the type, size, and location of the proposed structures or to the site grading are made, the recommendations contained in this report shall not be considered valid unless the changes are reviewed and the conclusions and recommendations modified in writing by LGCI. LGCI cannot accept responsibility for designs based on our recommendations unless we are engaged to review the final plans and specifications to determine whether any changes in the project affect the validity of our recommendations and whether our recommendations have been properly implemented in the design.

It is not part of our scope to perform a more detailed site history; therefore, we have not explored for or researched the locations of buried utilities or other structures in the area of the proposed construction. Our scope did not include environmental services or services related to moisture, mold, or other biological contaminants in or around the site.

The recommendations in this report are based in part on the data obtained from the subsurface explorations. The nature and extent of variations between explorations may not become evident until construction. If variations from anticipated conditions are encountered, it may be necessary to revise the recommendations in this report. We cannot accept responsibility for designs based on recommendations in this report unless we are engaged to 1) make site visits during construction to check that the subsurface conditions exposed during construction are in general conformance with our design assumptions and 2) ascertain that, in general, the work is being performed in compliance with the contract documents.

Our report has been prepared in accordance with generally accepted engineering practices and in accordance with the terms and conditions set forth in our agreement. No other warranty, expressed or implied, is made. This report has been prepared for the exclusive use of Vanasse Hangen Brustlin, Inc. for the specific application to the proposed transmission power line borings in Sudbury, Massachusetts as conceived at this time.

7. REFERENCES

1. The ground surface elevations was interpolated to the nearest foot from a plan titled: "Proposed Conditions Plan for Notice of Intent Submittal, Sudbury-Hudson Transmission Reliability Project, Sudbury, Massachusetts," prepared by Vanasse Hangen Brustlin, Inc. and dated February 5, 2018.
2. Groundwater observed at the end of drilling or based on sample moisture, whichever was measured last, as indicated on the boring logs.
3. Borings B-37, B-38, and B-MP-37 terminated in fill.
4. "-" means layer not encountered.

Contour Intervals: 3 meters

Figure based on USGS topographic map of Sudbury, MA obtained from www.mytopo.com/maps

Client: Vanasse Hangen Brustlin, Inc.	Project: Proposed Transmission Power Line Borings	Figure 1 – Site Location Map	
 LGCI Lahlaf Geotechnical Consulting, Inc.	Project Location: Sudbury, MA	LGCI Project No.: 1836	Date: December 2018

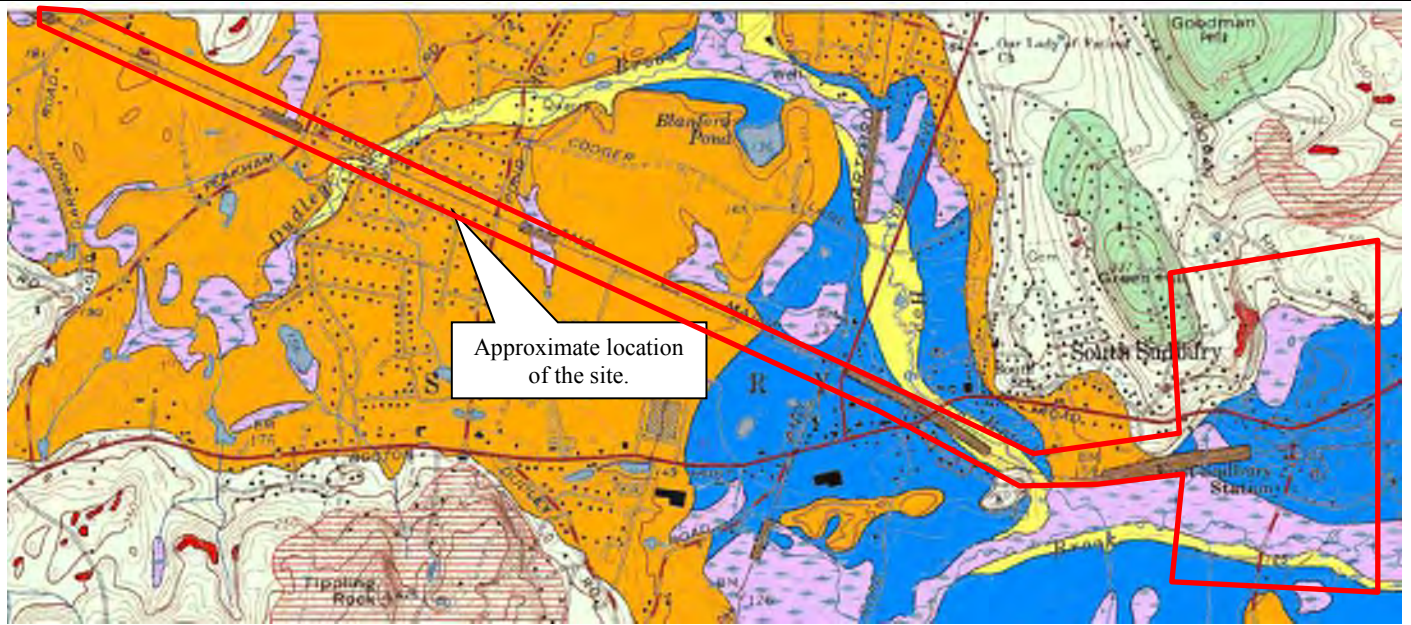

- Coarse deposits** include: *Gravel deposits* composed mainly of gravel-sized clasts; cobbles and boulders predominate; minor amounts of sand within gravel beds, and sand comprises few separate layers. Gravel layers generally are poorly sorted and bedding commonly is distorted and faulted due to postdepositional collapse related to melting of ice. *Sand and gravel deposits* composed of mixtures of gravel and sand within individual layers and as alternating layers. Sand and gravel layers generally range from 25 to 50 percent gravel particles and from 50 to 75 percent sand particles. Layers are well to poorly sorted; bedding may be distorted and faulted due to postdepositional collapse. *Sand deposits* composed mainly of very coarse to fine sand, commonly in well-sorted layers. Coarser layers may contain up to 25 percent gravel particles, generally granules and pebbles; finer layers may contain some very fine sand, silt, and clay.
- Swamp deposits**—Organic muck and peat that contain minor amounts of sand, silt, and clay, stratified and poorly sorted, in kettle depressions or poorly drained areas. Most swamp deposits are less than about 10 ft thick. Swamp deposits overlie glacial deposits or bedrock. They locally overlie glacial till even where they occur within thin glacial meltwater deposits.

Figure based on map titled: "Surficial Geologic Map of the Clinton-Concord-Grafton-Medfield 12-Quadrangle Area in East Central Massachusetts," prepared by Stone, B.D. and Stone, J.R. for U.S. Geological Survey, Open-File Report 2006-1260-A, 2006.

Client: Vanasse Hangen Brustlin, Inc.	Project: Proposed Transmission Power Line Borings	Figure 2A – Surficial Geologic Map	
 LGCI Lahlaf Geotechnical Consulting, Inc.	Project Location: Sudbury, MA	LGCI Project No.: 1836	Date: December 2018

Approximate location of the site.

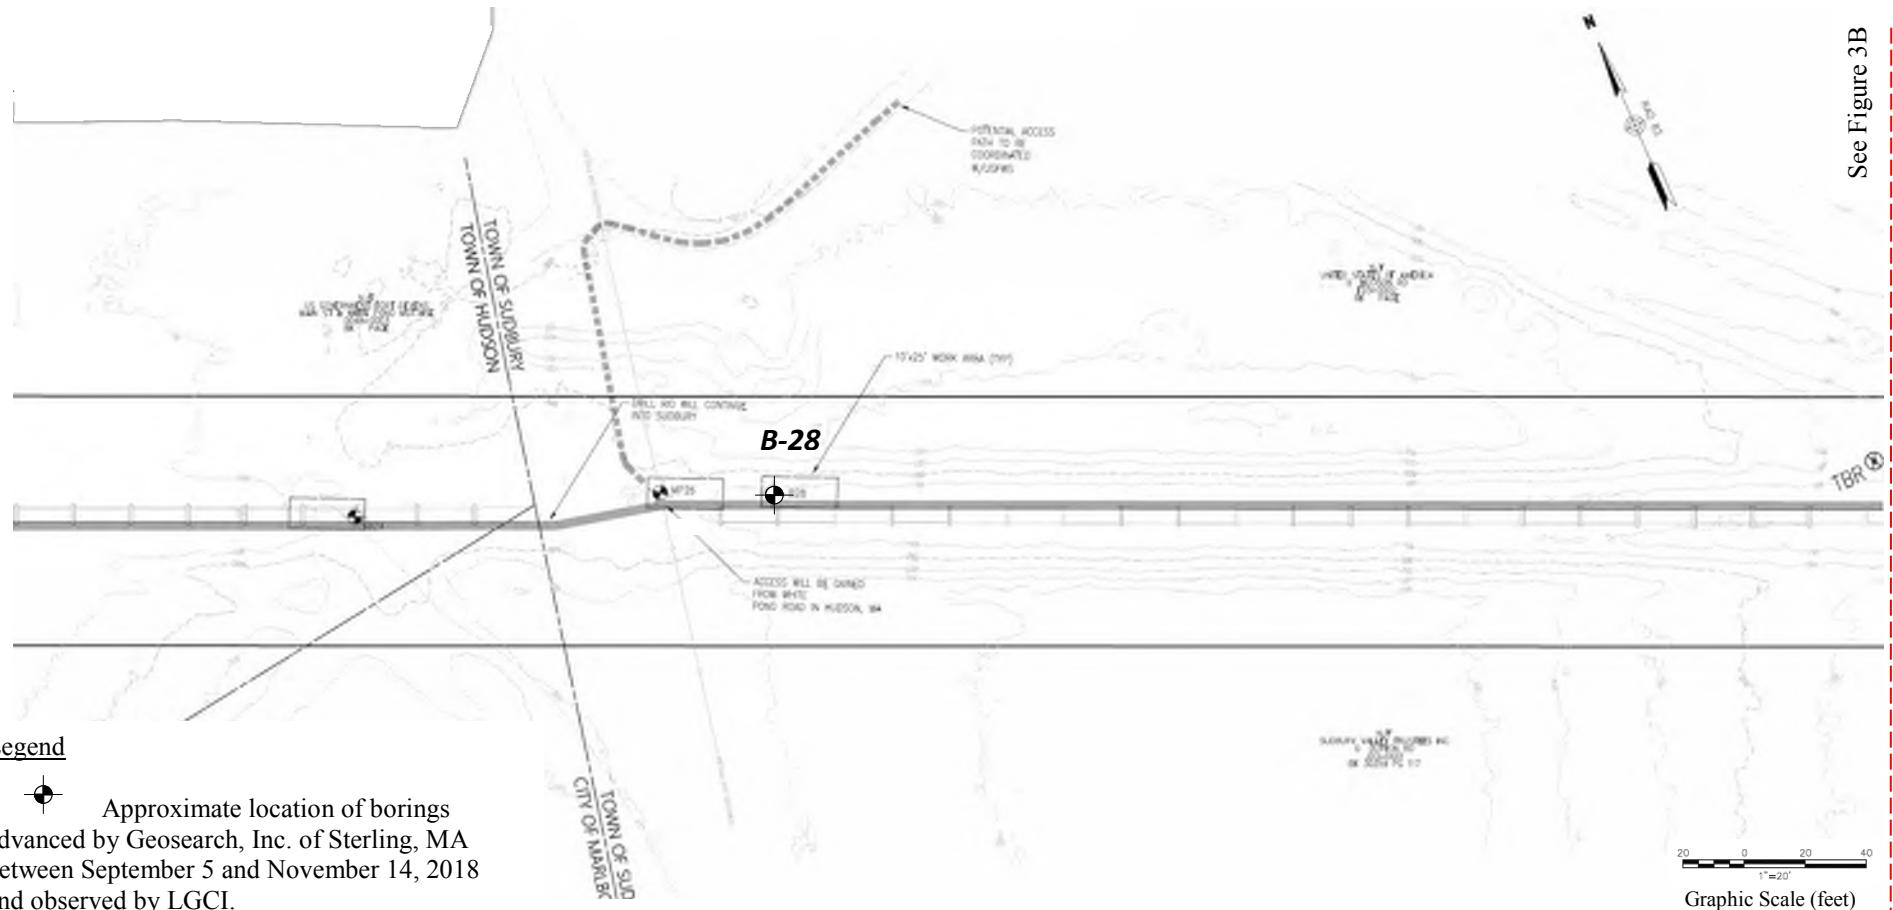

-  **Bedrock outcrops and areas of abundant outcrop or shallow bedrock**—Solid color shows extent of individual bedrock outcrops; line pattern indicates areas of shallow bedrock or areas where small outcrops are too numerous to map individually; in areas of shallow bedrock, surficial materials are less than 5-10 ft thick.
-  **Coarse deposits** include: Gravel deposits composed mainly of gravel-sized clasts; cobbles and boulders predominate; minor amounts of sand within gravel beds, and sand comprises few separate layers. Gravel layers generally are poorly sorted and bedding commonly is distorted and faulted due to postdepositional collapse related to melting of ice. Sand and gravel deposits composed of mixtures of gravel and sand within individual layers and as alternating layers. Sand and gravel layers generally range from 25 to 50 percent gravel particles and from 50 to 75 percent sand particles. Layers are well to poorly sorted; bedding may be distorted and faulted due to postdepositional collapse. Sand deposits composed mainly of very coarse to fine sand, commonly in well-sorted layers. Coarser layers may contain up to 25 percent gravel particles, generally granules and pebbles; finer layers may contain some very fine sand, silt, and clay.
-  **Fine deposits** include very fine sand, silt, and clay that occurs as well-sorted, thin layers of alternating silt and clay, or thicker layers of very fine sand and silt. Very fine sand commonly occurs at the surface and grades downward into rhythmically bedded silt and clay varves. Locally, this map unit may include areas underlain by fine sand.
-  **Thin till**—Nonsorted, nonstratified matrix of sand, some silt, and little clay containing scattered gravel clasts and few large boulders; in areas where till is generally less than 10-15 ft thick and including areas of bedrock outcrop where till is absent. Predominantly upper till of the last glaciation; loose, generally sandy, commonly stony. Two facies are present in some places; a looser, coarser-grained ablation facies, melted out from supraglacial position; and an underlying more compact, finer-grained lodgement facies deposited subglacially. In general, both ablation and lodgement facies of upper till derived from fine-grained bedrock are finer grained, more compact, less stony and have fewer surface boulders than upper till derived from coarser grained crystalline rocks. Fine-grained bedrock sources include the red Mesozoic sedimentary rocks of the Connecticut River lowland, marble in the western river valleys, and fine-grained schists in upland areas.
-  **Thick till**—Nonsorted, nonstratified matrix of sand, some silt, and little clay containing scattered gravel clasts and few large boulders at the surface; in the shallow subsurface, compact, nonsorted matrix of silt, very fine sand, and some clay containing scattered small gravel clasts in areas where till is greater than 10-15 ft thick, chiefly in drumlin landforms in which till thickness commonly exceeds 100 ft (maximum recorded thickness is 230 ft). Although upper till is the surface deposit, the lower till constitutes the bulk of the material in these areas. Lower till is moderately to very compact, and is commonly finer grained and less stony than upper till. An oxidized zone, the lower part of a soil profile formed during a period of interglacial weathering, is generally present in the upper part of the lower till. This zone commonly shows closely spaced joints that are stained with iron and manganese oxides.
-  **Artificial fill**—Earth materials and manmade materials that have been artificially emplaced, primarily in highway and railroad embankments, and in dams; may also include landfills, urban development areas, and filled coastal wetlands.
-  **Floodplain alluvium**—Sand, gravel, silt, and some organic material, stratified and well sorted to poorly sorted, beneath the floodplains of modern streams. The texture of alluvium commonly varies over short distances both laterally and vertically, and generally is similar to the texture of adjacent glacial deposits. Along smaller streams, alluvium is commonly less than 5 ft thick. The most extensive deposit of alluvium on the map is along the Charles, Assabet, and Concord Rivers where the texture is predominantly sand, fine gravel, and silt, and total thickness is as much as 25 ft. Alluvium typically overlies thicker glacial stratified deposits.
-  **Swamp deposits**—Organic muck and peat that contain minor amounts of sand, silt, and clay, stratified and poorly sorted, in kettle depressions or poorly drained areas. Most swamp deposits are less than about 10 ft thick. Swamp deposits overlie glacial deposits or bedrock. They locally overlie glacial till even where they occur within thin glacial meltwater deposits.

Appendix A - LGCI's Boring Logs

CLIENT: Vanasse Hangen Brustlin, Inc. **PROJECT NAME:** Proposed Transmission Power Lines
LGCI PROJECT NUMBER: 1836 **PROJECT LOCATION:** Sudbury, Massachusetts

DATE STARTED: 11/13/18 **DATE COMPLETED:** 11/13/18 **DRILLING SUBCONTRACTOR:** Geosearch, Inc.
BORING LOCATION: MBTA ROW **DRILLING FOREMAN:** Kenny Bylund
COORDINATES: NA **DRILLING METHOD:** Hollow Stem Auger (4-1/4" I.D.)
SURFACE EI.: 198 ft. (see note 1) **TOTAL DEPTH:** 10 ft. **DRILL RIG TYPE/MODEL:** CME 55 LC ATV
WEATHER: 50s / Sunny **HAMMER TYPE:** Automatic
GROUNDWATER LEVELS: **HAMMER WEIGHT:** 140 lb. **HAMMER DROP:** 30 in.
 ▽ **DURING DRILLING:** - **SPLIT SPOON DIA.:** 1.375 in. I.D., 2 in. O.D.
 ▼ **AT END OF DRILLING:** 5.4 ft. / El. 192.6 ft. **CORE BARREL SIZE:** NA
 ▼ **OTHER:** - **LOGGED BY:** KD **CHECKED BY:** MC

Depth (ft.)	EI. (ft.)	Sample Interval (ft.)	Sample Number	Blow Counts (N Value)	Pen./Rec. (in.)	Remark	Strata	Material Description
		0					Forest Mat	S1 - Encountered ~2 inches of forest mat material
		2	S1	3-2-7-2 (9)	24/17		Fill	Top 8": Silty SAND (SM), fine, trace medium, 25-30% fines, trace fine gravel, trace organic fines, trace coal ash, dark brown, moist Bot. 7": Silty SAND (SM), fine, trace medium, ~20% fines, ~5% fine subangular gravel, trace organic fines, light brown, moist
	195.0		S2	19-33-62-59 (95)	24/20			S2 - Silty SAND (SM), fine, trace medium to coarse, ~20% fines, 0-5% fine gravel, light brown, moist
		4						S3 - Similar to S2
5			S3	15-50-64-71 (114)	24/21			▼
		6					Sand	S4 - Silty SAND (SM), fine, trace medium to coarse, ~15% fines, ~5% fine gravel, light brown, moist
	190.0	7.5						
		8						S5 - Well Graded SAND with Silt and Gravel (SW-SM), fine to medium, trace coarse, 10-15% fines, ~15% fine to coarse gravel, light brown, wet
			S5	13-26-18-14 (44)	24/10			
10		10						Bottom of borehole at 10.0 feet. Backfilled borehole with drill cuttings.
	185.0							
15								
	180.0							
20								
	175.0							
25								

GENERAL NOTES:

1. The ground surface elevation was interpolated to the nearest foot based on a drawing titled: "Proposed Conditions Plans for Notice of Intent Submittal, Sudbury-Hudson Transmission Reliability Project, Sudbury, Massachusetts," prepared by VHB and dated February 5, 2018.

Re: **Geotechnical Report**
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836

Dear Mr. McKinlay:

Lahlaf Geotechnical Consulting, Inc. (LGCI) has completed a geotechnical study for the proposed Transmission Power Line in Hudson, Massachusetts. We are submitting this report electronically, please notify us if you need a hard copy.

The soil samples from our explorations are currently stored at LGCI for further analysis, if requested. Unless notified otherwise, we will dispose of the soil samples after three months.

Thank you for choosing LGCI as your geotechnical engineer.

Very truly yours,

Lahlaf Geotechnical Consulting, Inc.

Abdelmadjid M. Lahlaf, Ph.D., P.E.
Principal Engineer

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836**

1. PROJECT INFORMATION

1.1 Project Authorization

This report presents the results of subsurface explorations and a geotechnical evaluation performed by Lahlaf Geotechnical Consulting, Inc. (LGCI) for the proposed transmission power line in Hudson, Massachusetts. We performed our services in general accordance with our proposal No. 16006-Rev. 3 dated January 23, 2016 and revised June 19, 2018.

1.2 Purpose and Scope of Services

The purpose of this geotechnical study was to obtain subsurface information at the site and to provide foundation design and construction recommendations for the utility vaults along the proposed transmission power line. LGCI performed the following services:

- Provided a geotechnical senior and field engineer to attend a site meeting with Vanasse Hangen Brustlin, Inc. (VHB) representatives and the drilling subcontractor's crew on May 22, 2018.
- Provided a geotechnical field engineer at the site. The engineer coordinated and observed the borings, described the soil samples, and prepared field logs.
- Submitted six (6) soil samples for laboratory testing.
- Performed two (2) borehole permeability tests.
- Prepared this geotechnical report containing the results of our subsurface explorations and our recommendations for foundation design and construction related to the proposed transmission power line.

This report presents the results of our geotechnical services for the Hudson portion of this project. We understand that more subsurface explorations will be advanced in the Sudbury portion at a future date.

Our scope did not include attending meetings, preparing specifications, reviewing contract documents and shop drawings, or providing construction services. LGCI would be pleased to perform these services when needed. Recommendations for stormwater management, erosion control, pavement design, subgrade preparation for roadways and other paved areas, slope stability analyses, and detailed cost or quantity estimates are not included in our scope of work.

Our scope does not include performing environmental services for this project. LGCI did not perform an environmental assessment to evaluate the presence or absence of wetlands or analytical testing for hazardous or toxic materials in the soil, surface water, groundwater, or air,

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts

on or below this site, or mold in the soil or any structure at this site. Any statement about the color, odor, or the presence of suspicious materials included in our boring logs or report were made by LGCI for information only and to support our geotechnical services. No environmental recommendations and/or opinions are included in this report.

1.3 Site Description

Our understanding of the existing conditions is based on field observations, our discussions with VHB, and on the following drawing:

- “Proposed Conditions Plans for Notice of Intent (NOI) Submittal, Sudbury-Hudson Transmission Reliability Project, Hudson, Massachusetts,” (NOI Plans) prepared by VHB and dated February 14, 2018.

The site extends along Forest Avenue, Wilkins Street, and an abandoned MBTA railroad. Forest Avenue and Wilkins Street extend through residential areas. Private properties are located on either side of Forest Avenue and Wilkins Street. The site includes a four-way intersection where Forest Avenue and Wilkins Street intersect with Main Street. Overhead wires extend from the Hudson Light and Power Department, located at 49 Forest Avenue, along Forest Avenue and continue along Wilkins Street. Boulders up to 2 feet in diameter were observed on the northern edge of Forest Avenue near Jack’s Automotive, located at 104 Forest Avenue.

The abandoned MBTA railroad intersects Wilkins Street near the East Hudson Trail point and Orchard Drive. The abandoned railroad tracks are built on a 5-foot embankment that extends through wooded areas and wetlands. Trees and boulders up to 4 feet in diameter were observed on either side of the embankment. Based on the NOI Plans and our field observations there appears to be approximately 12 feet of fill placed on the railroad bed when Chestnut Street was constructed. The abandoned railroad crosses over the Fort Meadow Brook over an existing timber bridge. The railroad extends along industrial and residential areas on the eastern side of the Fort Meadow Brook. Private properties border the railroad on either side. The railroad intersects with Main Street, Parmenter Road, and White Pond Road. Figure 1 shows the approximate extend of the project site.

The ground surface elevations of the portion of the project along the different areas listed above are as follows:

- Between El. 214 on the western side and El. 216 on the eastern side of Forest Avenue with a local high at about El. 245;
- Between El. 214 on the western side and El. 220 on the eastern site of Wilkins Street; and
- Between El. 224 on the western side and El. 192 on the eastern side of the abandoned MBTA railroad with a local low of El. 180 near the Fort Meadow Brook.

1.4 Project Description

Our understanding of the proposed transmission power line is based on our discussions with VHB and the NOI Plans listed in Section 1.3 and the following drawings:

- “Line 1151 South End Glenbrook, 115-kV Underground Transmission Line, Splice Vault Detail, Stamford, Connecticut,” prepared by Northeast Utilities Service Co. and dated May 10, 2013.
- “Cross Sections, Sudbury Hudson Transmission Line Reliability Project, Hudson, Stow, Marlborough, and Sudbury, Massachusetts,” (Cross Sections) prepared by VHB for Eversource Energy and dated July 2, 2018.

We understand that Eversource Energy (Eversource) engaged VHB to coordinate and observe a subsurface exploration for its proposed transmission power line. The transmission power line will be a 115-kV underground transmission power line connecting a substation in Hudson to a substation in Sudbury and will extend along a proposed bike path that will be constructed along the abandoned railroad bed.

We understand that the construction of the proposed transmission power line will include twenty-eight (28) vaults, three (3) bridges, and two (2) retaining walls as follows:

- Fourteen (14) vaults in Hudson and fourteen (14) vaults in Sudbury;
- Two (2) bridges (Chestnut Street Bridge and Fort Meadow Brook Bridge) in Hudson, and one (1) bridge (Hop Brook Bridge No. 127) in Sudbury.
- One (1) retaining wall in Hudson and one (1) retaining wall in Sudbury.

This report focuses on the portion of the proposed transmission power line in Hudson. Work related to the Sudbury line will be performed at a later date and will be described in a future report.

The Hudson portion of the transmission power line extends approximately 3 miles. The proposed transmission power line will be installed within a trench that will generally extend to depths of about 5 feet beneath the ground surface. We understand that the proposed transmission power line will be encased in concrete.

We understand that the proposed vaults will be spaced 1,500 to 1,900 feet apart. We also understand that the proposed vaults will have a length of 24 feet, a width of 8 feet, and a height of 8 feet. VHB indicated to us that the vaults will likely have a wall thickness of 6 inches. The vaults will be designed with two (2) 3-foot manholes per vault. The vaults are generally placed at a depth of 11 feet. This is to provide 2 feet between the top of the vault and the proposed finished grade for manhole brick work.

Based on the Cross Sections, the proposed retaining wall will extend from about Sta. 119+00 to Sta. 125+00, i.e., and will be about 600 feet long. The cross sections indicated that the exposed

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836**

height of the proposed wall ranges up to about 4 feet. VHB indicated to us that the current design includes sheet piles for the proposed wall. We understand that concrete a cap will be provided on top of the sheet piles.

1.5 Elevation Datum

We understand that elevations shown in the NOI Plans are referenced with respect to the North American Vertical Datum (NAVD) of 1988 and are in feet.

2. SITE AND SUBSURFACE CONDITIONS

2.1 Surficial Geology

LGCI reviewed the surficial geological map titled: “Surficial Geologic Map of the Clinton-Concord-Grafton-Medfield 12-Quadrangle Area in East Central Massachusetts,” compiled by Bryon D. Stone and Janet R. Stone for U.S. Geological Survey, Open-File report (2006).

The geologic map indicates that the surficial soil in the general vicinity of the site consists of organic muck and peat that contain minor amounts of sand, silt, and clay, stratified and poorly sorted in kettle depressions or poorly drained areas. The surficial geologic map of the site is shown in Figure 2.

2.2 LGCI’s Borings

VHB engaged Geosearch, Inc. (Geosearch) of Sterling, Massachusetts to advance thirty-seven (37) borings for the Hudson portion of the project between May 22 and July 13, 2018 as follows:

- Four (4) borings for the proposed bridges, the results of which are included in a separate report; and
- Thirty-three (33) borings for the proposed transmission power line. One of the bridge borings at the Fort Meadow Brook crossing was also advanced at an intermediate location along the proposed transmission power line and was combined with a transmission power line boring.

The borings extended to depths ranging from 10 to 101 feet beneath the ground surface. An LGCI engineer observed and logged the borings in the field. A representative from VHB was on site to collect soil samples from the borings along the proposed transmission power line for laboratory testing, including thermal resistivity, oil and/or hazardous materials, proctor, and grain-size analysis. The results of the tests performed by VHB are not included in our report.

Geosearch performed vacuum explorations at borings B-8, B-MP-1, B-MP-3, B-MP-4, B-MP6, and B-MP-9 to B-MP-11 to depths of about 6 feet.

The borings located in paved areas along Forest Avenue and Wilkins Street (B-MP-3, B-MP-4, B-MP-6, B-MP-9 to B-MP-11, and B-8) were advanced with a CME 55 truck mounted rig by employing 4 ¼-inch hollow stem augers to a depth of up to 16 feet.

Four (4) borings (B-13, and B-25 to B-27) were advanced with a tripod using a Honda GX200 motor. These borings were located in sections along the MBTA railroad that were inaccessible with a rubber track ATV rig. These borings were advanced to depths up to 16 feet.

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836**

The remaining borings were advanced in a grass area along Forest Street or on the MBTA railroad, and were advanced with a CME 55 LC rubber track ATV rig by employing 4 ¼-inch hollow stem augers to a depth of up to 30 feet. Boring B-BB-3/B-14 was advanced to a depth of 101 feet with a CME 55 LC rubber track ATV by employing 4 ¼-inch hollow stem augers to a depth of 12 feet, and then by employing a 4-inch casing to a depth of 29 feet and a 3-inch casing to the termination depth of the boring.

The drillers performed Standard Penetration Tests (SPT) and obtained split spoon samples with an automatic hammer typically at depth intervals of 2 feet or 5 feet, as noted on the boring logs, in general accordance with ASTM D-1586. Unless notified otherwise, we will dispose of the soil samples after three months.

Figure 3 shows the boring locations, and Appendix A contains LGCI's boring logs. The ground surface elevations noted on the boring logs were interpolated to the nearest foot from the NOI Plans.

2.3 Subsurface Conditions

2.3.1 General

The subsurface description in this report is based on a limited number of borings and is intended to highlight the major soil strata encountered during our borings. The subsurface conditions are known only at the actual boring locations. Variations may occur and should be expected between boring locations. The boring logs represent conditions that we observed at the time of our explorations and were edited, as appropriate, based on the results of the laboratory test data and inspection of the soil samples in the laboratory. The strata boundaries shown in our boring logs are based on our interpretations and the actual transition may be gradual. Graphic soil symbols are for illustration only.

Our subsurface descriptions were broken down into two sections: proposed transmission power line borings and retaining wall borings

2.3.2 Proposed Transmission Power Line Borings

This section describes the subsurface conditions encountered in the borings along or near the alignment of the proposed transmission power line, including borings B-8 to B-11, B-GB-10, B-13, B-14/B-BB-3, B-21 to B-27, B-MP-1, B-MP-3, B-MP-4, B-MP-6, and B-MP-9 to MP-11, B-MP-15, B-MP-17, B-MP-19, B-MP-20, and B-MP-22 to B-MP-24.

The soil strata encountered in the borings were as follows, starting at the ground surface:

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836**

Asphalt – A layer of asphalt was encountered in borings B-8, B-MP-3, B-MP-4, B-MP-6, and B-MP-9 to B-MP-11. The depth of the asphalt ranged between 0.7 to 0.9 feet below the ground surface.

Surficial Organic Soil – A layer of surficial organic topsoil and subsoil was encountered in borings B-9, B-10, B-13, B-21 to B-24, B-MP-1, B-MP-19, B-MP-20, and B-MP-22 to B-MP-24. This layer generally consisted of silty sand with organic fines, roots, leaves, grass, and wood. This layer had a thickness ranging between 0.1 and 4 feet but was generally less than 1.5 feet thick.

Fill – A layer of fill was encountered at the ground surface along the abandoned MBTA railroad in borings B-11/B-GB-10, B-BB-3/B-14, B-25 to B-27, B-MP-15, and B-MP-17. Fill was also encountered underneath the asphalt or surficial organic layers, except in borings B-22, B-MP-6, B-MP-10, B-MP-20, B-MP-23, and B-MP-24.

The fill was mostly described as poorly graded sand and less frequently as silty sand or well graded sand. There were two (2) samples in boring B-GB-13 that were described as silty gravel. The fines content in the fill ranged up to 30 percent but was generally between 5 and 20 percent. The gravel content in the fill ranged up to 40 percent, but generally ranged between 5 and 25 percent. The fill contained traces of organic fines, roots, and wood. The fill along Forest Avenue and Wilkins Street contained traces of asphalt. The fill along the abandoned MBTA railroad contained traces of coal ash and slag.

The Standard Penetration Test (SPT) N-values in this layer ranged between 1 and 93 blows per foot (bpf), with most values between 9 and 28 indicating loose to medium dense material.

Buried Organic Soil – A layer of buried organic soil was encountered beneath the fill in borings B-9, B-10, B-11/B-GB-10, B-BB-3/B-14, B-21, B-24, B-27, B-MP-15 and extended to depths of up to 10 feet beneath the ground surface, except in boring B-BB-3/B-14 located near the existing Fort Meadow Brook bridge, where the buried organics extended to a depth of 20 feet below the ground surface. The buried organics contained fibrous peat, organic fines, roots, and wood.

As a part of the Eversource transmission power line project, borings were advanced for the proposed Fort Meadow Brook bridge. In boring B-BB-4, advanced for the proposed bridge, the layer of buried organics extended to a depth of 25 feet.

Sand – A layer of sand was encountered beneath the asphalt, surficial organic soil, fill, or buried organic soil in all the borings and extended to the boring termination depths. The sand layer was mostly described as well graded sand and less frequently as poorly graded sand and occasionally as silty sand. The fines content in the sand ranged up to 30 percent,

but generally ranged between 5 and 20 percent. The gravel content in the sand ranged up to 45 percent, but generally ranged between 5 and 15 percent.

The SPT N-values in the sand ranged between 5 and 135 bpf, with most values between 5 and 49 bpf indicating loose to dense sand.

2.3.3 Proposed Retaining Wall Borings

This section describes the subsurface conditions encountered in the borings along or near the alignment of the proposed retaining wall, including borings B-GB-7, B-GB-8, B-11/B-GB-10, and B-GB-12 to B-GB-16.

The soil strata encountered within the borings were as follows, starting at the ground surface:

Topsoil – A layer of topsoil was encountered at the ground surface of borings B-GB-15 and B-GB-16. The topsoil thickness ranged between 5 and 6 inches.

Fill – A layer of fill was encountered at the ground surface or beneath the topsoil in all the borings advanced along or near the alignment of the proposed retaining wall. The fill extended to depths ranging between 2 and 6.6 feet beneath the ground surface. Coal was encountered at the ground surface in borings B-GB-7, B-GB-8, B-11/B-GB-10, and B-GB-12. The fill was mostly described as silty sand and poorly graded sand with silt, and occasionally as silty gravel. The fines content in the fill ranged between 5 and 40 percent. The gravel content in the fill ranged between 5 and 20 percent. The fill contained traces of asphalt, organic fines, wood, roots, leaves and slag.

The SPT N-values of the fill ranged between 1 and 93 bpf, with most values between 1 and 21 bpf, indicating very loose to medium dense material. The relatively high SPT N-Values recorded in the fill may be caused by cobbles and boulders in the fill and may not represent the true density.

Buried Organic Soil – A layer of buried organic soil was encountered beneath the fill in borings B-GB-7, G-GB-8, and B-11/B-GB-10. The buried organics extended to depths ranging between 6 to 8 feet beneath the ground surface. The buried organics consisted of silty sand with traces of organic fines and roots.

Sand – A layer of sand was encountered beneath the fill or buried organics in all borings advanced near the alignment of the proposed retaining wall. The sand layer extended to the termination depth of the borings. The sand was mostly described as silty sand and less frequently as poorly graded sand or well graded sand. The fines content in the sand ranged between 5 and 30 percent. The gravel content in the sand ranged between 5 and 35.

The SPT N-values in the sand ranged between 9 and over 120 bpf, with most values between 13 and 75 bpf, indicating mostly medium dense to very dense sand.

2.4 Groundwater

2.4.1 General

The groundwater data obtained during drilling and reported in this report is based on observations made during or shortly after completion of our explorations and may not represent the actual groundwater levels, as additional time may be required for the groundwater to stabilize. The groundwater levels presented in this report only represent the conditions encountered at the time and location of our explorations. Seasonal fluctuation should be anticipated.

Please note that our groundwater measurements were performed during the period between May and July. The groundwater levels are anticipated to be higher during the months of the wet season in early spring.

2.4.2 Proposed Transmission Power line

Groundwater was encountered in all the borings advanced along or near the alignment of the proposed transmission power line, except in borings B-8, B-MP-6, B-MP-15, and B-MP-24. Groundwater was encountered at depths of up to 13 feet beneath the ground surface, but generally ranged between 5 and 10 feet along Forest Avenue and Wilkins Street and between 4 and 13 feet along the MBTA railroad.

2.4.3 Proposed Retaining Wall

Groundwater was encountered in all the borings along or near the alignment of the proposed retaining wall at depths of up to 20 feet beneath the ground surface, but generally ranged between 8 and 15 feet.

The groundwater levels measured during drilling are based on observations made shortly after the completion of the explorations. Note that water was introduced into each borehole to maintain a stable borehole and the water levels noted may not represent the actual groundwater level, as additional time may be required for the groundwater levels to stabilize. The groundwater levels presented in this report only represent the conditions encountered at the time and location of the explorations. Seasonal fluctuation should be anticipated.

2.5 Borehole Permeability Tests

LGCI performed two (2) falling head borehole permeability tests in borings B-MP-19 and B-24. The tests were performed by filling the drill casing with water and measuring the drop in water level inside the casing. The tests were performed at the depths shown below:

- Boring B-MP-19: 12 feet to 14 feet
- Boring B-24: 12 feet to 14 feet,

The results of the borehole permeability tests are included in Attachment C. The results indicated that permeability of the soil at depths of 12 to 14 feet in borings B-MP-19 and B-24 is about 1.1×10^{-4} cm/sec and 3.3×10^{-4} cm/sec, respectively.

2.6 Laboratory Test Data

LGCI submitted six (6) samples for laboratory testing. The results are summarized in the table below. The laboratory data sheets are included in Appendix B.

Results of Grain-size Analyses

Boring No.	Sample No.	Stratum	Sample depth (ft.)	Percent Gravel	Percent Sand	Percent Fines
B-24	S4	Nat. Sand	6 – 8	0.7	94.2	5.1
B-24	S7	Nat. Sand	12 – 14	0.0	96.1	3.9
B-GB-13	S2	Fill	2 – 4	42.6	41.8	15.6
B-GB-16	S3	Nat. Sand	4 – 6	7.0	88.7	4.3
B-GB-19	S4	Nat. Sand	6 – 8	9.1	71.5	19.4
B-GB-19	S7	Nat. Sand	12 – 14	28.4	67.9	3.7

3. EVALUATION AND RECOMMENDATIONS

3.1 General

Based on our understanding of the proposed transmission power line, our observation of the borings, and the results of our laboratory testing, there are a few issues that we would like to highlight for consideration and discussion.

- Buried organic soil was encountered in many borings. The depth to the bottom of the organic soil was generally less than 10 feet. Accordingly, the presence of the organic soil is not anticipated to affect the proposed vaults. The proposed vaults should be supported on Structural Fill placed directly on top of the natural sand. Our recommendations for bearing resistance for the proposed vaults are presented in Section 3.2.
- The sheet pile wall is well suited for the subsurface conditions encountered in our borings, as it will not require the removal of the existing fill and the buried organic soil. The presence of the organic soil may result in longer sheet piles. Also, fill placed to raise the grades near the proposed retaining wall will result in settlement induced by the compression of the buried organic soil. This settlement will not affect the proposed vaults, transmission power lines, or sheet pile retaining wall. The contractor should be prepared to pre-trench to remove boulders at locations where boulders are encountered ahead of the sheet pile driving operations.
- At Sta. 119+25, the proposed wall will cross an existing culvert with a diameter of about 2 feet. Soldier piles could be driven on both sides of the existing culvert and should be fastened to the sheet pile wall on either side. Pressure treated wood or concrete lagging could be used down to the top of the culvert. The wedges on the sides of the existing culvert should be filled with flowable fill or drypack.
- The subsurface conditions encountered in our borings are in general suitable to support the proposed duct bank encasement of the proposed transmission power line as the trench for the proposed transmission power line will terminate in existing fill or natural soil. In a few locations, the proposed transmission power line trench will terminate in the organic soil or at the bottom of the existing fill, just above the organic soil. At these locations, we recommend over-excavating the organic soil and backfilling the trench to the bottom of the proposed transmission power line using suitable backfill. Where the organic soil is more than 2 feet from the bottom of the proposed transmission power line trench, the organic soil should not be removed. Additional recommendations for supporting the proposed transmission power line are presented in Section 4.1.
- Boulders were encountered at boring B-MP-3 at a depth of 6 feet and drill chattering was observed in the borings along the MBTA railroad. The contractor should be prepared to encounter boulders during excavation and should be prepared to remove the boulders from the site.

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836**

- The existing fill along the MBTA railroad contained varying amounts of organic matter and coal. Due to the presence of coal ash, these materials will have to be pre-characterized before disposal offsite. To reduce the quantity of material to be disposed of offsite, the contractor should be prepared to segregate the inorganic portion of the existing fill and amend it as needed to improve its gradation for reuse as backfill.. Our recommendations for fill materials and for reuse of onsite materials are presented in Sections 4.3 and 4.4, respectively.
- We anticipate that groundwater control will be required to construct the proposed vaults. The design and the construction sequence should be performed so as to allow for the construction of the proposed vaults in a dry excavation and to reduce the potential for uplift of the vault at the end of dewatering operations. Groundwater control will also be required along portions of the transmission power line trenches. Our recommendations for groundwater control are presented in Section 4.7.
- Foundations should be designed in accordance with the requirements of the Massachusetts State Building Code, Ninth Edition (MSBC 9th edition).

3.2 Vault Recommendations

- We recommend supporting the proposed vaults on a minimum of 12 inches of Structural Fill bearing on natural sand. In areas where the proposed transmission power line trench terminates in the buried organic soil or less than 2 feet from the top of the organic soil, the organic soil should be removed at least 2 feet beneath the bottom of the trench or to the natural sand, whichever occurs first.
- We recommend an allowable bearing pressure of 3 kips per square foot (ksf) for vaults bearing on natural sand.
- The vaults should be designed with slabs and walls thick enough such that the weight of the vault resists uplift pressure. We recommend a minimum factor of safety of 1.1 against uplift.
- We recommend that the vault walls be designed using at-rest pressure and to resist the hydrostatic pressure as described in section 3.4.

3.3 Seismic Design

In accordance with Section 1613 of MSBC 9th Edition, the seismic criteria for the site are as follows:

Site Class:	D
Spectral Response Acceleration at short period (S _s):	0.197g
Spectral Response Acceleration at 1 sec. (S ₁):	0.068g
Site Coefficient F _a (Table 9.4.1.2.4a):	1.6

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836**

Site Coefficient F_v (Table 9.4.1.2.4b):	2.4
Adjusted spectral response S_{ms} :	0.315 g
Adjusted spectral responses S_{m1} :	0.163g

Based on our observations of the borings, the natural soil layer at the site is not susceptible to liquefaction during a seismic event.

3.4 Lateral Pressures for Wall Design

Lateral earth pressures recommended for design of the proposed retaining wall and vault walls are provided in the section below.

We recommend using the following values for retaining wall design:

Coefficient of Active Earth Pressure, K_A :	0.31
Coefficient of Active Earth Pressure, K_P in Top 5 feet	2.0
Coefficient of Active Earth Pressure, K_P at depths greater than 5 feet:	4.1
Coefficient of At-Rest Earth Pressure, K_0 :	0.50
Friction Angle between Backfill and Back of Wall, δ :	10 degrees
Total Unit Weight, γ :	120 pcf
Buoyant Unit Weight γ' :	57.4 pcf

Note: The coefficient of active pressure value is based on Coulomb's equation using an internal friction angle for the backfill, ϕ , of 30 degrees and a friction angle between the backfill and the structure, δ , of 10 degrees. The coefficients of active and at-rest earth pressure are provided for wall backfill with a horizontal surface (non-sloping backfill) on the active side for the retaining wall. The coefficient of passive earth pressure is provided for a sloping ground with a slope of 3H:1V in the top 5 feet.

- The proposed vault walls should be designed using the “at-rest” pressure coefficient.
- The length of the proposed sheet pile wall obtained using the design parameters recommended above should be increased by the thickness of the buried topsoil.
- We recommend placing free-draining material consisting of Structural Fill or crushed stone within the 3 feet immediately behind retaining walls. The sheet pile wall should be provided with weep hole near the bottom of the wall to promote drainage.
- The design of the sheet pile wall should include a traffic surcharge equivalent to 200 pounds per square foot.

3.5 Seismic Pressure

In accordance with the MSBC 9th Edition, Section 1610, a lateral earthquake force equal to $0.100 \cdot (S_s) \cdot (F_a) \cdot \gamma \cdot H^2$ should be included in the design of walls (for horizontal backfill), where S_s

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836**

is the maximum considered earthquake spectral response acceleration (defined in Section 3.3), F_a is the site coefficient (defined in Section 3.3), γ is the total unit weight of the soil backfill, and H is the height of the wall.

The earthquake force should be distributed as an inverted triangle over the height of the wall. In accordance with MSBC 9th Edition, Section 1610.2, a load factor of 1.43 shall be applied to the earthquake force for wall strength design.

Temporary surcharges should not be included when designing for earthquake loads. Surcharge loads applied for extended periods of time shall be included in the total static lateral soil pressure and their earthquake lateral force shall be computed and added to the force determined above.

4. CONSTRUCTION CONSIDERATIONS

4.1 Subgrade Preparation

- Existing asphalt, existing fill, organic soil, abandoned utilities, and other below-ground structures should be entirely removed from within an area extending at least 2 feet beyond the limits of the proposed vaults.
- The proposed vault excavations should extend to 12 inches below the proposed bottom of vaults. Should existing fill, organic soil, or other deleterious material be present at these depths, it should be removed and replaced with compacted Structural Fill to the top of the natural sand or 2 feet beneath the bottom of the proposed vault, whichever occurs first.
- The subgrade of the vaults in the natural sand, should be compacted with a dynamic vibratory compactor imparting a minimum of 10 kips of force to the subgrade.
- Should boulders be encountered at the vault subgrade, the boulders should be removed, and the resulting excavation should be backfilled with compacted Structural Fill meeting the gradation requirements in Section 4.3.
- Loose or soft soils identified during the compaction of the footing subgrades that cannot be compacted in place should be excavated to a suitable bearing stratum as determined by the representative of LGCI. Grades should be restored by backfilling with Structural Fill.
- When crushed stone is required in the drawings or it is used for the convenience of the contractor, it should be wrapped in a geotextile fabric for separation except where introduction of the geotextile promotes sliding. A geotextile should not be placed between the bottoms of the footings and crushed stone.
- The proposed transmission power line trench should extend to at least 12 inches beneath the bottom of the transmission power line. Where the excavation terminates in organic soil or less than 2 feet from the top of the organic soil, the excavation should be continued to the natural sand layer or 2 feet beneath the bottom of the transmission power line, whichever occurs first. The over-excavation should be backfilled with Ordinary Fill meeting the gradation requirements in Section 4.3.
- An LGCI representative should observe the exposed foundation subgrades prior to fill and concrete placement to verify that the exposed bearing materials are suitable for the design soil bearing pressure. If soft or loose pockets are encountered in the footing excavations, the soft or loose materials that cannot be compacted in place should be removed, and the bottom of the footing should be placed at a lower elevation on firm soil, or the resulting excavation should be backfilled with Gravel Borrow, or crushed stone wrapped in a filter fabric.

4.2 Subgrade Protection

The onsite natural sand is frost susceptible. If construction takes place during freezing weather, special measures should be taken to prevent the subgrade from freezing. Such measures should include the use of heat blankets or excavating the final six inches of soil just before pouring concrete. Soil used as backfill should be free of frozen material, as should the ground on which it is placed. Filling operations should be halted during freezing weather.

Materials with high fines content are typically difficult to handle when wet as they are sensitive to moisture content variations. Subgrade support capacities may deteriorate when such soils become wet and/or disturbed. The contractor should keep exposed subgrades properly drained and free of ponded water. Subgrades should be protected from machine and foot traffic to reduce disturbance.

4.3 Fill Materials

Structural Fill and Ordinary Fill should consist of inert, hard, durable sand and gravel, free from organic matter, clay, surface coatings and deleterious materials, and should conform to the gradation requirements shown below.

4.3.1 Structural Fill

The Structural Fill should have a plasticity index of less than 6 and should meet the gradation requirements shown below. Structural Fill should be compacted in maximum 9-inch loose lifts to at least 95 percent of the Modified Proctor maximum dry density (ASTM D1557), with moisture contents within ± 2 percentage points of optimum moisture content.

Sieve Size	Percent Passing by Weight
3 inches	100
1 ½ inch	80 - 100
½ inch	50 – 100
No. 4	30 – 85
No. 20	15 – 60
No. 60	5 – 35
No. 200*	0 – 10

4.3.2 Ordinary Fill

Ordinary Fill should have a plasticity index of less than 6 and should meet the gradation requirements shown below. Ordinary Fill should be compacted in maximum 9-inch loose

**Geotechnical Report
Proposed Transmission Power Line Borings
Hudson, Massachusetts
LGCI Project No. 1836**

lifts to at least 95 percent of the Modified Proctor maximum dry density (ASTM D1557), with moisture contents within ± 2 percentage points of optimum moisture content.

Sieve Size	Percent Passing by Weight
6 inches	100
1 inch	50 - 100
No. 4	20 - 100
No. 20	10 - 70
No. 60	5 - 45
No. 200	0 - 20

4.4 Reuse of Onsite Materials

Based on our field observations and the results of the grain-size analyses, we do not anticipate that the site soils will meet the gradation requirements of Structural Fill. Some of the existing fill meets the gradation requirements of Ordinary Fill. Should the contractor encounter materials potentially suitable for reuse during earthwork operations, the contractor should avoid mixing the reusable soils with unsuitable soils. The soils to be reused should be excavated and stockpiled separately for compliance testing. The contractor should be prepared to amend the existing fill free of organics to meet the gradation requirements for Ordinary Fill for reuse as trench backfill.

Soils with 20 percent or greater fines content are generally very sensitive to moisture content variations and are susceptible to frost. Such soils are very difficult to compact at moisture contents that are much higher or much lower than the optimum moisture content determined from the laboratory compaction test. Therefore, strict moisture control should be implemented during compaction of onsite soils with fines contents of 20 percent or greater. The contractor should be prepared to remove and replace such soils if pumping occurs.

4.5 Contractor Submittals

The contractor should submit details about the construction procedures, including:

- The proposed construction sequence;
- Temporary earth support system for the proposed vaults if any; and
- Groundwater control system.

Contractor submittals should be prepared and sealed by a professional engineer registered in the Commonwealth of Massachusetts and should be submitted for review at least two weeks before the start of the work.

4.6 Temporary Excavations

All excavations to receive human traffic should be constructed in accordance with the OSHA guidelines.

The site soils should generally be considered Type “C” and should have a maximum allowable slope of 1.5 Horizontal to 1 Vertical (1.5H:1V) for excavations less than 20 feet deep. Deeper excavations, if needed, should have shoring designed by a professional engineer.

The contractor is solely responsible for designing and constructing stable, temporary excavations and should shore, slope, or bench the sides of the excavations as required to maintain stability of the excavation sides and bottom.

4.7 Groundwater Control Procedures and Flow Rate Estimates

4.7.1 General

We anticipate that groundwater control procedures will be needed during the excavation for the proposed vaults to handle the groundwater. We recommend that the contractor design and submit a plan to collect and remove groundwater prior to the start of the excavations. Such a plan should include at a minimum multiple sump pump pits extending at least 3 feet beneath the bottom of the excavation.

Groundwater levels should be maintained at a minimum of 1-foot below the bottom of excavations during construction. The contractor should be permitted to employ whatever commonly accepted means and practices are available to dewater.

To reduce the potential for sinkholes developing over sump pump pits after the sump pumps are removed, the crushed stone placed in the sump pump pits should be wrapped in a geotextile fabric. Alternatively, the crushed stone should be entirely removed after the sump pump is no longer in use and the sump pump pit should be restored with suitable backfill.

Groundwater collected from excavations should be filtered for fines in sedimentation basins before being discharged. At a minimum, the sedimentation basins should be constructed of hay bales wrapped in a geotextile fabric.

The contractor should discharge groundwater from the dewatering system in accordance with permits and local and state regulations.

4.7.2 Flow Rate Estimates

We estimated the anticipated quantity of flow in the proposed vault excavations and the proposed utility trench. We assumed a groundwater depth of 5 feet, vault excavation dimensions of 30 feet by 10 feet with an excavation depth of 12 feet, and a utility trench depth of 6 feet.

Using the coefficient of permeability values listed in Sections 2.5, we estimate a quantity of flow ranging between 1,000 and 3,000 gal/day for the proposed vaults and between 12.5 and 37.5 gal/day per foot of excavation for the proposed transmission line.

5. RECOMMENDATIONS FOR FUTURE WORK

We recommend engaging LGCI to perform the following services:

- Assist VHB during the design of the proposed sheet pile wall;
- Review the geotechnical aspects of contractor submittals.
- Provide a field representative to observe the subgrades of foundations during construction.

6. REPORT LIMITATIONS

Our analysis and recommendations are based on project information provided to us at the time of this report. If changes to the type, size, and location of the proposed structures or to the site grading are made, the recommendations contained in this report shall not be considered valid unless the changes are reviewed and the conclusions and recommendations modified in writing by LGCI. LGCI cannot accept responsibility for designs based on our recommendations unless we are engaged to review the final plans and specifications to determine whether any changes in the project affect the validity of our recommendations and whether our recommendations have been properly implemented in the design.

It is not part of our scope to perform a more detailed site history; therefore, we have not explored for or researched the locations of buried utilities or other structures in the area of the proposed construction. Our scope did not include environmental services or services related to moisture, mold, or other biological contaminants in or around the site.

The recommendations in this report are based in part on the data obtained from the subsurface explorations. The nature and extent of variations between explorations may not become evident until construction. If variations from anticipated conditions are encountered, it may be necessary to revise the recommendations in this report. We cannot accept responsibility for designs based on recommendations in this report unless we are engaged to 1) make site visits during construction to check that the subsurface conditions exposed during construction are in general conformance with our design assumptions and 2) ascertain that, in general, the work is being performed in compliance with the contract documents.

Our report has been prepared in accordance with generally accepted engineering practices and in accordance with the terms and conditions set forth in our agreement. No other warranty, expressed or implied, is made. This report has been prepared for the exclusive use of Vanasse Hangen Brustlin, Inc. for the specific application to the proposed transmission power line in Hudson, Massachusetts as conceived at this time.

- The boring numbers are not in sequence as many borings were renumbered prior to the start of drilling. Borings labeled "B" were borings that included geotechnical and thermal resistivity sampling. Borings labeled "GB" were borings that included geotechnical sampling for the proposed retaining wall. Borings labeled "BB" were borings that included geotechnical sampling for the proposed bridge. Borings labeled "MP" were multipurpose borings that included geotechnical, thermal resistivity, and oil and/or hazardous materials sampling.
- The ground surface elevations was interpolated to the nearest foot from a plan titled: "Proposed Conditions Plan for Notice of Intent Submittal, Sudbury-Hudson Transmission Reliability Project, Hudson, Massachusetts," prepared by Vanasse Hangen Brustlin, Inc. and dated February 14, 2018.
- Groundwater observed at the end of drilling or based on sample moisture, as indicated on the boring logs.
- "-" means layer not encountered.

Contour Intervals: 3 meters

Figure based on USGS topographic map of Hudson, MA obtained from www.mytopo.com/maps

Client:	Project:	Figure 1 – Site Location Map	
Vanasse Hangen Brustlin, Inc.	Proposed Transmission Power Line Borings		
 LGCI Lahlaf Geotechnical Consulting, Inc.	Project Location: Hudson, MA	LGCI Project No.: 1836	Date: August 2018

- 
Coarse deposits include: Gravel deposits composed mainly of gravel-sized clasts; cobbles and boulders predominate; minor amounts of sand within gravel beds, and sand comprises few separate layers. Gravel layers generally are poorly sorted and bedding commonly is distorted and faulted due to postdepositional collapse related to melting of ice. Sand and gravel deposits composed of mixtures of gravel and sand within individual layers and as alternating layers. Sand and gravel layers generally range from 25 to 50 percent gravel particles and from 50 to 75 percent sand particles. Layers are well to poorly sorted; bedding may be distorted and faulted due to postdepositional collapse. Sand deposits composed mainly of very coarse to fine sand, commonly in well-sorted layers. Coarser layers may contain up to 25 percent gravel particles, generally granules and pebbles; finer layers may contain some very fine sand, silt, and clay.

- 
Thin till—Nonsorted, nonstratified matrix of sand, some silt, and little clay containing scattered gravel clasts and few large boulders; in areas where till is generally less than 10-15 ft thick and including areas of bedrock outcrop where till is absent. Predominantly upper till of the last glaciation; loose to moderately compact, generally sandy, commonly stony. Two facies are present in some places: a looser, coarser-grained ablation facies, melted out from supraglacial position; and an underlying more compact, finer-grained lodgement facies deposited subglacially. In general, both ablation and lodgement facies of upper till derived from fine-grained bedrock are finer grained, more compact, less stony and have fewer surface boulders than upper till derived from coarser grained crystalline rocks. Fine-grained bedrock sources include the red Mesozoic sedimentary rocks of the Connecticut River lowland, marble in the western river valleys, and fine-grained schists in upland areas.

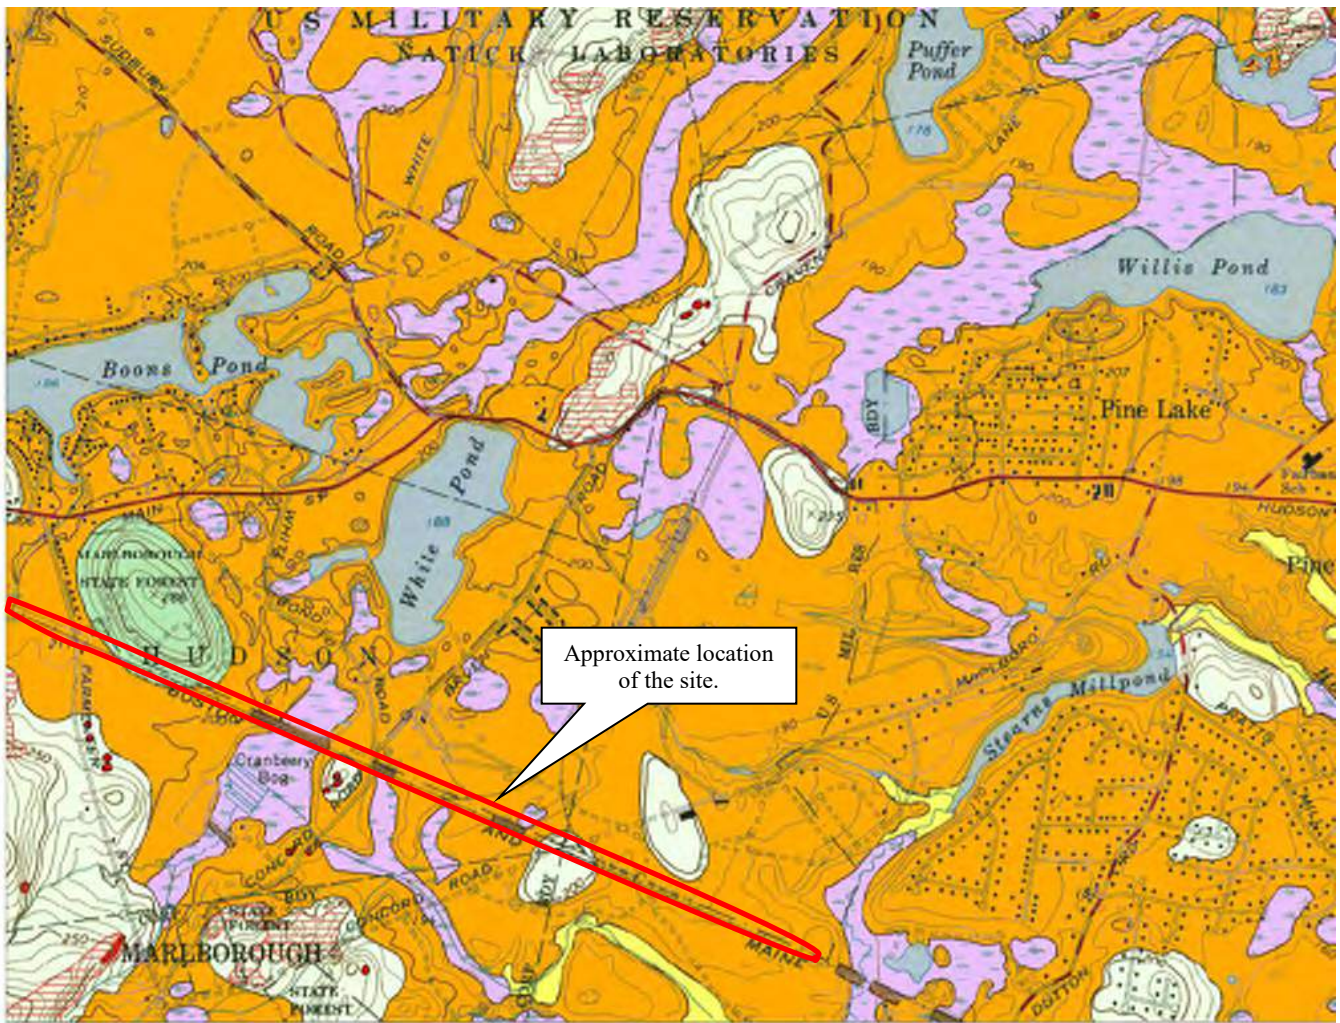

- 
Swamp deposits—Organic muck and peat that contain minor amounts of sand, silt, and clay, stratified and poorly sorted, in kettle depressions or poorly drained areas. Most swamp deposits are less than about 10 ft thick. Swamp deposits overlie glacial deposits or bedrock. They locally overlie glacial till even where they occur within thin glacial meltwater deposits.

Key Plan

Note

Figure based on a drawing titled: “Proposed Conditions Plans for Notice of Intent Submittal, Sudbury-Hudson Transmission Reliability Project, Hudson, Massachusetts,” prepared by Vanasse Hangen Brustlin, Inc., and dated February 14, 2018.

Client: Vanasse Hangen Brustlin, Inc.	Project: Proposed Transmission Power Line Borings	Figure 3U – Boring Location Plan	
 LGCI Lahlaf Geotechnical Consulting, Inc.	Project Location: Hudson, MA	LGCI Project No.: 1836	Date: August 2018

Appendix A - LGCI's Boring Logs

CLIENT: Vanasse Hangen Brustlin, Inc. **PROJECT NAME:** Proposed Transmission Power Line Borings
LGCI PROJECT NUMBER: 1836 **PROJECT LOCATION:** Hudson, Massachusetts

DATE STARTED: 6/11/18 **DATE COMPLETED:** 6/11/18 **DRILLING SUBCONTRACTOR:** Geosearch, Inc.
BORING LOCATION: Roadway near 6 Wilkins Street **DRILLING FOREMAN:** Justin Emma
COORDINATES: NA **DRILLING METHOD:** Hollow Stem Augers 4-1/4" I.D.
SURFACE EI.: 218 ft. NAVD 88 (see note 1) **TOTAL DEPTH:** 10 ft. **DRILL RIG TYPE/MODEL:** CME 55 Truck Rig
WEATHER: 70s / Sunny **HAMMER TYPE:** Automatic
GROUNDWATER LEVELS: **HAMMER WEIGHT:** 140 lb. **HAMMER DROP:** 30 in.
 ▽ **DURING DRILLING:** - **SPLIT SPOON DIA.:** 1.375 in. I.D., 2 in. O.D.
 ▼ **AT END OF DRILLING:** Not encountered **CORE BARREL SIZE:** NA
 ▼ **OTHER:** - **LOGGED BY:** TS **CHECKED BY:** NB

Depth (ft.)	EI. (ft.)	Sample Interval (ft.)	Sample Number	Blow Counts (N Value)	Pen./Rec. (in.)	Remark	Strata	Material Description
		0.7					Asphalt	Drilled through 8 inches of asphalt.
	215.0		G1				Fill	G1 - Silty SAND (SM), fine to medium, trace coarse, ~15% fines, trace fine subangular gravel, brown, moist
5		3.5	G2			G2 - Well Graded SAND with Silt and Gravel (SW-SM), fine to coarse, 5-10% fines, ~25% fine to coarse subrounded gravel, trace coal, brown, moist		
		6				1	Sand	REMARK 1: Borehole was previously vacuum explored to a depth of 6 feet on 6/6/18.
	210.0		S1	2-4-5-3 (9)	24/7	S1 - Well Graded SAND with Gravel (SW), fine to coarse, 0-5% fines, ~15% fine subrounded gravel, light brown, moist		
		8						S2 - Similar to S1, weathered rock fragments, light brown to tan
10		10						Bottom of borehole at 10.0 feet. Backfilled borehole with drill cuttings. Restored ground surface with asphalt cold patch.

					Average	1.33E-04

NOTES:

- 1 - Test procedure used was a falling head test in an open borehole.
- 2 - Hydraulic Conductivity, $K = (d^2 \ln(2mL/D)) / (8L(t_2 - t_1)) \ln(H_1/H_2)$, per Lambe & Whitman, Soil Mechanics, 1969, p. 285, case G: isotropic conditions and L/D not less than 4.
- 3 - H represents the difference between static ground water level and water level in casing.
- 4 - Average calculated over straight line portion of plot above (bold values in table).

VARIABLE HEAD PERMEABILITY TEST

Perm. Tests
Hudson, MA
LGCI Project: 1836

LGCI Rep.: T. Sinnott
Calculated by: T. Sinnott
Checked by: AML

Date: 06/28/17 Boring No. : B-24
Date: 06/29/17 Test No. : #1
Date: 08/15/18 Page 1 of 1

STANDPIPE/RISER DETAILS

Casing inner diam, d, inches: 4.0
Casing length, feet: 15.0
Casing stick up length, feet
(above ground surface) : 3.0
Initial Water Depth
(below top of casing): 15.0

TEST INTERVAL DETAILS

Depth to bottom, feet
(below ground surface): 14.0
Depth to top, feet
(below ground surface): 12.0
Length, L, feet: 2.0
Hole diameter, D, inches: 5.00

Material at 12 ft to 14 ft
test interval: Poorly Graded SAND (SP), fine to medium, 0-5% fines
m = 1 i.e., isotropic material

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

39 Spruce Street * East Longmeadow, MA 01028 * FAX 413/525-6405 * TEL. 413/525-2332
SW-846 8081B

Qualifications:**DL-03**

Elevated reporting limit due to matrix.

Analyte & Samples(s) Qualified:

18J0192-01[MP-40]

SW-846 8082A

Qualifications:**O-32**

A dilution was performed as part of the standard analytical procedure.

Analyte & Samples(s) Qualified:

18J0192-01[MP-40]

SW-846 8151A

Qualifications:**V-05**

Continuing calibration did not meet method specifications and was biased on the low side for this compound.

Analyte & Samples(s) Qualified:**2,4,5-T [2C]**

B213836-BLK1, B213836-BSD1

2,4-DB [2C]

B213836-BLK1, B213836-BSD1

SW-846 8260C

Qualifications:**L-07A**

Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD outside of control limits. Reduced precision anticipated for any reported result for this compound.

Analyte & Samples(s) Qualified:**2-Butanone (MEK)**

B214054-BS1

Acetone

B214054-BS1

R-05

Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.

Analyte & Samples(s) Qualified:**1,2,4-Trichlorobenzene**

18J0192-01[MP-40], B214054-BLK1, B214054-BS1, B214054-BSD1

2-Butanone (MEK)

18J0192-01[MP-40], B214054-BLK1, B214054-BS1, B214054-BSD1

2-Hexanone (MBK)

18J0192-01[MP-40], B214054-BLK1, B214054-BS1, B214054-BSD1

Acetone

18J0192-01[MP-40], B214054-BLK1, B214054-BS1, B214054-BSD1

Bromochloromethane

18J0192-01[MP-40], B214054-BLK1, B214054-BS1, B214054-BSD1

Bromomethane

18J0192-01[MP-40], B214054-BLK1, B214054-BS1, B214054-BSD1

Dibromomethane

18J0192-01[MP-40], B214054-BLK1, B214054-BS1, B214054-BSD1

V-20

Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:**1,2,3-Trichloropropane**

B214054-BS1, B214054-BSD1, S028040-CCV1

V-34

Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.

Analyte & Samples(s) Qualified:**Bromomethane**

18J0192-01[MP-40], B214054-BLK1, B214054-BS1, B214054-BSD1, S028040-CCV1

V-36

Initial calibration verification (ICV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:**1,4-Dioxane**

B214054-BS1, B214054-BSD1, S028040-CCV1

SW-846 8270D**Qualifications:****V-05**

Continuing calibration did not meet method specifications and was biased on the low side for this compound.

Analyte & Samples(s) Qualified:**Aniline**

B214109-BLK1, B214109-BS1, B214109-BSD1

Bis(2-chloroisopropyl)ether

B214109-BLK1, B214109-BS1, B214109-BSD1

Pyridine

B214109-BLK1, B214109-BS1, B214109-BSD1

V-06

Continuing calibration did not meet method specifications and was biased on the high side for this compound.

Analyte & Samples(s) Qualified:**3,3-Dichlorobenzidine**

B214109-BS1, B214109-BSD1

Hexachlorobutadiene

B214109-BS1, B214109-BSD1

V-19

Initial calibration did not meet method specifications. Compound was calibrated using linear regression with correlation coefficient <0.99. Reported result is estimated.

Analyte & Samples(s) Qualified:**2,4-Dinitrophenol**

18J0192-01[MP-40], B214109-BLK1, B214109-BS1, B214109-BSD1

V-20

Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:**3,3-Dichlorobenzidine**

B214109-BLK1

Hexachlorobutadiene

B214109-BLK1

V-34

Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.

Analyte & Samples(s) Qualified:**4-Chloroaniline**

18J0192-01[MP-40], B214109-BLK1, B214109-BS1, B214109-BSD1

Aniline

18J0192-01[MP-40]

SW-846 9045C**Qualifications:****H-03**

Sample received after recommended holding time was exceeded.

Analyte & Samples(s) Qualified:**pH**

18J0192-01[MP-40], B213948-DUP1

SW-846 8100 Modified

TPH (C9-C36) is quantitated against a calibration made with a diesel standard.

SW-846 8260C

Laboratory control sample recoveries for required MCP Data Enhancement 8260 compounds were all within limits specified by the method except for "difficult analytes" where recovery control limits of 40-160% are used and/or unless otherwise listed in this narrative. Difficult analytes: MIBK, MEK, acetone, 1,4-dioxane, chloromethane, dichlorodifluoromethane, 2-hexanone, and bromomethane.

SW-846 8270D

Laboratory control sample recoveries for required MCP Data Enhancement 8270 compounds were all within control limits specified by the method, 40-140% for base/neutrals and 30-130% for acids except for "difficult analytes" listed below and/or otherwise listed in this narrative. Difficult analytes limits are 15 and 140%: 2,4-dinitrophenol, 4-chloroaniline, 4-nitrophenol, and phenol.

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

FLAG/QUALIFIER SUMMARY

*	QC result is outside of established limits.
†	Wide recovery limits established for difficult compound.
‡	Wide RPD limits established for difficult compound.
#	Data exceeded client recommended or regulatory level
ND	Not Detected
RL	Reporting Limit is at the level of quantitation (LOQ)
DL	Detection Limit is the lower limit of detection determined by the MDL study
MCL	Maximum Contaminant Level
	Percent recoveries and relative percent differences (RPDs) are determined by the software using values in the calculation which have not been rounded.
	No results have been blank subtracted unless specified in the case narrative section.
DL-03	Elevated reporting limit due to matrix.
H-03	Sample received after recommended holding time was exceeded.
L-07A	Either laboratory fortified blank/laboratory control sample or duplicate recovery is outside of control limits, but the other is within limits. RPD outside of control limits. Reduced precision anticipated for any reported result for this compound.
L-14	Compound classified by MA CAM as difficult with acceptable recoveries of 40-160%. Recovery does not meet 70-130% criteria but does meet difficult compound criteria.
O-32	A dilution was performed as part of the standard analytical procedure.
R-05	Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.
V-05	Continuing calibration did not meet method specifications and was biased on the low side for this compound.
V-06	Continuing calibration did not meet method specifications and was biased on the high side for this compound.
V-16	Response factor is less than method specified minimum acceptable value. Reduced precision and accuracy may be associated with reported result.
V-19	Initial calibration did not meet method specifications. Compound was calibrated using linear regression with correlation coefficient <0.99. Reported result is estimated.
V-20	Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.
V-34	Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.
V-36	Initial calibration verification (ICV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

CASE NARRATIVE SUMMARY

All reported results are within defined laboratory quality control objectives unless listed below or otherwise qualified in this report.

For method 8151, samples were derivatized on 10/17/18.

For method 8151, sample analysis bracketed by LCS to monitor esterification. All recoveries in the bracketing LCS met method criteria.

SW-846 8081B

Qualifications:**DL-03**

Elevated reporting limit due to matrix.

Analyte & Samples(s) Qualified:

18J0746-01[MP32]

P-02

Sample RPD between primary and confirmatory analysis exceeded 40%. Per EPA method 8000, the lower value was reported due to obvious chromatographic interference on the column with the higher result.

Analyte & Samples(s) Qualified:**4,4'-DDE**

18J0746-02[MP34]

SW-846 8082A

Qualifications:**O-32**

A dilution was performed as part of the standard analytical procedure.

Analyte & Samples(s) Qualified:

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49]

SW-846 8100 Modified

Qualifications:**MS-19**

Sample to spike ratio is greater than or equal to 4:1. Spiked amount is not representative of the native amount in the sample. Appropriate or meaningful recoveries cannot be calculated.

Analyte & Samples(s) Qualified:**TPH (C9-C36)**

B215078-MS1, B215078-MSD1

SW-846 8151A

Qualifications:**V-06**

Continuing calibration did not meet method specifications and was biased on the high side for this compound.

Analyte & Samples(s) Qualified:**Dinoseb**

B214866-BS1, B214866-BSD1

Dinoseb [2C]

B214866-BS1, B214866-BSD1

V-20

Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:**Dinoseb**

B214866-BLK1

V-35

Initial calibration verification (ICV) did not meet method specifications and was biased on the high side for this compound. Reported result is estimated.

Analyte & Samples(s) Qualified:**Dinoseb**

B214866-BLK1, B214866-BS1, B214866-BSD1

Dinoseb [2C]

B214866-BLK1, B214866-BS1, B214866-BSD1

SW-846 8260C

Qualifications:

R-05

Laboratory fortified blank duplicate RPD is outside of control limits. Reduced precision is anticipated for any reported value for this compound.

Analyte & Samples(s) Qualified:**Acetone**

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49], B215140-BLK1, B215140-BS1, B215140-BSD1

V-16

Response factor is less than method specified minimum acceptable value. Reduced precision and accuracy may be associated with reported result.

Analyte & Samples(s) Qualified:**1,4-Dioxane**

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49], B215140-BLK1, B215140-BS1, B215140-BSD1

Tetrahydrofuran

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49], B215140-BLK1, B215140-BS1, B215140-BSD1

V-20

Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:**Methylene Chloride**

B215140-BS1, B215140-BSD1

V-34

Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.

Analyte & Samples(s) Qualified:**Bromomethane**

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49], B215140-BLK1, B215140-BS1, B215140-BSD1

V-36

Initial calibration verification (ICV) did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:**1,4-Dioxane**

B215140-BS1, B215140-BSD1

SW-846 8270D**Qualifications:****V-05**

Continuing calibration did not meet method specifications and was biased on the low side for this compound.

Analyte & Samples(s) Qualified:**2,4-Dinitrophenol**

B215149-BLK1, B215149-BS1, B215149-BSD1

Aniline

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49]

Pyridine

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49]

V-06

Continuing calibration did not meet method specifications and was biased on the high side for this compound.

Analyte & Samples(s) Qualified:**4-Nitrophenol**

B215149-BS1, B215149-BSD1

V-19

Initial calibration did not meet method specifications. Compound was calibrated using linear regression with correlation coefficient <0.99. Reported result is estimated.

Analyte & Samples(s) Qualified:**2,4-Dinitrophenol**

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49]

V-20

Continuing calibration did not meet method specifications and was biased on the high side. Data validation is not affected since sample result was "not detected" for this compound.

Analyte & Samples(s) Qualified:**4-Nitrophenol**

B215149-BLK1

V-34

Initial calibration verification (ICV) did not meet method specifications and was biased on the low side for this compound. Reported result is estimated.

Analyte & Samples(s) Qualified:**4-Chloroaniline**

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49], B215149-BLK1, B215149-BS1, B215149-BSD1

Aniline

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49], B215149-BLK1, B215149-BS1, B215149-BSD1

SW-846 9045C**Qualifications:****H-03**

Sample received after recommended holding time was exceeded.

Analyte & Samples(s) Qualified:**pH**

18J0746-01[MP32], 18J0746-02[MP34], 18J0746-03[SB49]

SW-846 8100 Modified

TPH (C9-C36) is quantitated against a calibration made with a diesel standard.

SW-846 8260C

Laboratory control sample recoveries for required MCP Data Enhancement 8260 compounds were all within limits specified by the method except for "difficult analytes" where recovery control limits of 40-160% are used and/or unless otherwise listed in this narrative. Difficult analytes: MIBK, MEK, acetone, 1,4-dioxane, chloromethane, dichlorodifluoromethane, 2-hexanone, and bromomethane.

SW-846 8270D

Laboratory control sample recoveries for required MCP Data Enhancement 8270 compounds were all within control limits specified by the method, 40-140% for base/neutrals and 30-130% for acids except for "difficult analytes" listed below and/or otherwise listed in this narrative. Difficult analytes limits are 15 and 140%: 2,4-dinitrophenol, 4-chloroaniline, 4-nitrophenol, and phenol.

The results of analyses reported only relate to samples submitted to the Con-Test Analytical Laboratory for testing.

I certify that the analyses listed above, unless specifically listed as subcontracted, if any, were performed under my direction according to the approved methodologies listed in this document, and that based upon my inquiry of those individuals immediately responsible for obtaining the information, the material contained in this report is, to the best of my knowledge and belief, accurate and complete.

Tod E. Kopycinski
Laboratory Director

Volatile Organic Compounds by GC/MS

Analyte	Results	RL	Units	Dilution	Flag/Qual	Method	Date Prepared	Date/Time Analyzed	Analyst
Hexachlorobutadiene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
2-Hexanone (MBK)	ND	0.0098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Isopropylbenzene (Cumene)	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
p-Isopropyltoluene (p-Cymene)	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Methyl tert-Butyl Ether (MTBE)	ND	0.0020	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Methylene Chloride	ND	0.0049	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
4-Methyl-2-pentanone (MIBK)	ND	0.0098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Naphthalene	ND	0.0049	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
n-Propylbenzene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Styrene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,1,1,2-Tetrachloroethane	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,1,1,2,2-Tetrachloroethane	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Tetrachloroethylene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Tetrahydrofuran	ND	0.0049	mg/Kg dry	1	V-16	SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Toluene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,2,3-Trichlorobenzene	ND	0.0020	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,2,4-Trichlorobenzene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,1,1-Trichloroethane	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,1,2-Trichloroethane	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Trichloroethylene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Trichlorofluoromethane (Freon 11)	ND	0.0049	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,2,3-Trichloropropane	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,2,4-Trimethylbenzene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
1,3,5-Trimethylbenzene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
Vinyl Chloride	ND	0.0049	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
m+p Xylene	ND	0.0020	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF
o-Xylene	ND	0.00098	mg/Kg dry	1		SW-846 8260C	10/18/18	10/18/18 11:53	MFF

Surrogates	% Recovery	Recovery Limits	Flag/Qual
1,2-Dichloroethane-d4	100	70-130	10/18/18 11:53
Toluene-d8	96.3	70-130	10/18/18 11:53
4-Bromofluorobenzene	95.2	70-130	10/18/18 11:53

39 Spruce Street * East Longmeadow, MA 01028 * FAX 413/525-6405 * TEL. 413/525-2332

Project Location: Sudbury, MA

Sample Description:

Work Order: 18J0746

Date Received: 10/15/2018

Field Sample #: MP32

Sampled: 10/11/2018 10:15

Sample ID: 18J0746-01

Sample Matrix: Soil

Semivolatile Organic Compounds by GC/MS

Analyte	Results	RL	Units	Dilution	Flag/Qual	Method	Date Prepared	Date/Time Analyzed	Analyst
Acenaphthene	ND	0.20	mg/Kg dry	1		SW-846 8270D	10/18/18	10/23/18 21:25	BGL
