1. EXECUTIVE SUMMARY

The Sudbury Station Comprehensive Permit 40B Project (“Proposed Project”) is a residential rental project submitted to the Sudbury Zoning Board of Appeals by Sudbury Station, LLC (“Applicant”). Professional Services Corporation, PC (PSC) was engaged by the Town of Sudbury to prepare this Transportation Impact Assessment (TIA) addressing the impacts of two alternatives, the 30-Unit Approved Townhouse Project Alternative (“Approved Townhouse Project”) and the 250-unit Submitted Project Alternative (“Submitted Project”).

The “Approved Townhouse Project” is a 30 unit rental project approved by the Sudbury Zoning Board of Appeals that is served by a single two-lane, two-way primary access drive that intersects with Hudson Road east of Peakham Road.

The “Submitted Project” is a 250 unit rental project that includes 36 townhouses and 214 units in mid-rise buildings that is served by two entrances, one on Hudson Road and one connecting to Concord Road using a newly constructed Peter’s Way.

The traffic impacts of the Sudbury Station Comprehensive Permit (40B) were previously evaluated in the “Traffic Impact and Access Study, The Village at Sudbury Station 40B Development, Hudson Road, Sudbury, Massachusetts, Prepared for Sudbury Station, LLC, December 2015” prepared by MDM Transportation Consultants, Inc. (“Submitted TIAS”). This TIA differs significantly from the “Submitted TIAS” because it uses updated traffic data, technical references, capacity analysis methodology, and trip generation data.

The Transportation Study Area (TSA) for this TIA includes the signalized Hudson Road/Concord Road/Old Sudbury Road Intersection, the unsignalized Peakham Road/Hudson Road Intersection, the unsignalized Concord Road/Candy Hill Road Intersection and the two proposed unsignalized intersections serving as project entrances.

New automatic traffic recorder (ATR) counts and manual turning movement counts at the TSA intersections were obtained on Thursday, May 24, 2018 and represent midweek conditions.

The “Approved Townhouse Project” will generate 280 vehicle trips (140 entering, 140 exiting) per 24 hours with 24 vehicle trips (6 entering, 18 exiting) in the weekday AM peak hour and 28 trips (18 entering, 10 exiting) in the weekday PM peak hour. The “Submitted Project” will generate 1492 vehicle trips (715 entering, 714 exiting) per 24 hours with 92 vehicle trips (23 entering, 69 exiting) in the weekday AM peak hour and 28 trips (18 entering, 10 exiting) in the weekday PM peak hour. In comparison to the “Approved Townhouse Project”, the “Submitted Project” will generate 511% of the trips generated by the “Approved Townhouse Project” per day, 383% in the weekday AM peak hour and 418% in the weekday PM peak hour.

The Concord Road/Candy Hill Road Intersection operates at unacceptable levels-of-service. It operates at capacity, level-of-service E (LOS E) with the 2018 Existing traffic volumes in the AM peak hour and with excessive delay (LOS F) during the PM peak hour. With the 2025 No-Build, the “Approved Townhouse Project” 2025 Build, and the “Submitted Project” 2025 Build traffic volumes, delay and volume to capacity ratios (v/c) increase from the 2018 Existing to the 2025 No-Build to the 2025 Build traffic volumes with the worst delays and v/c and being those calculated for the “Submitted Project” 2025 Build traffic volumes.

The Peckham Road/Hudson Road Intersection operates with very poor levels-of-service and extreme delays and extreme queues on Peakham Road northbound. Delay and volume to capacity ratios (v/c) increase from the 2018 Existing to the 2025 No-Build to the 2025 Build traffic volumes with the worst delays and v/c ratios and being those calculated for the “Submitted Project” 2025 Build traffic volumes.

The Concord Road/Candy Hill Road Intersection operates at LOS C based on the eastbound Candy Hill Road approach with both the AM and PM 2018 Existing traffic volumes. The intersection operates at LOS D with the AM and PM 2025 No-Build and the AM and PM 2025 Build traffic volumes.

The Primary Site Drive/Hudson Road Intersection operates with unacceptable delays (LOS F) with the 2025 Build traffic volumes with the highest v/c and longest delay with the “Submitted Project” 2025 Build traffic volumes.

The Peter’s Way and Concord Road Intersection is only constructed with the “Submitted Project.” With the 2025 Build volumes, it operates at level-of-service C with the AM peak hour traffic volumes and level-of-service B with the PM peak hour traffic volumes.

For many of the approach lanes at the intersections in the Traffic Study Area with the 2018 Existing, the 2025 No-Build, and the 2025 Build traffic volumes, the volumes exceed capacity and queue length cannot accurately be modeled using the Highway Capacity Manual methods and actual queues may be longer. This applies to 6 of the 7 approach lanes at the Hudson Road/Concord Road/Old Sudbury Road Intersection as well as to the northbound approach lane at the Peakham Road/Hudson Road Intersection. Therefore the analysis presented herein may underestimate actual queue lengths.

At the Hudson Road/Concord Road/Old Sudbury Road Intersection, 95th percentile PM queues (2025 No-Build/Build) exceed the available storage length of 325 ft. for the eastbound left turn lane and the 50th and 95th percentile AM and PM queues exceed the available storage length of 750 ft. for the eastbound through lane for certain peak hour volumes. When the eastbound through queues exceed 750 feet, which commonly occurs, the queues block traffic from entering the Peakham Road/Hudson Road Intersection. The 95th percentile PM queues (2025

No-Build/Build) for the westbound through/right lane commonly exceed 1,000 ft. The 50th and 95th percentile queues exceed the available storage length of 375 ft. for the northbound left turn lane for certain peak hour volumes.

For the southbound approach to the Hudson Road/Concord Road/Old Sudbury Road Intersection, queues longer than 1,350 ft. will block the proposed Peter's Way and Concord Road Intersection. For the southbound approach volume exceeds capacity for all analyzed volumes (except 2018 Existing AM 50th percentile) and queue length cannot accurately be modeled. Observation of actual southbound queues show that Peter's Way is blocked by southbound queues for the entire 2 hours between 4:00 and 6:00 PM except for 5 minutes.

At the Peakham Road/Hudson Road Intersection, the northbound approach is severely over capacity and queues are excessive. With the 2018 Existing volumes, the AM peak hour 95th percentile queues range from 985 ft. AM to 610 ft. PM. With the "Submitted Project" 2025 Build volumes, queues range from 1,340 ft. AM to 827 ft. PM

Safety concerns regarding the segment of Concord Road at the Primary Site Drive/Hudson Road Intersection and Concord Road/Candy Hill Road Intersection led the Zoning Board of Appeals to preclude use of Peter's Way as a project entrance. In fact, a vehicle crash resulting in a fatality was reported at the Concord Road/Candy Hill Road Intersection in 2016.

Maintaining a minimum safe separation distance between the centerlines of intersections is a key to satisfy operational and safety concern. Based on the 85th percentile travel speed of vehicles on Concord Road, the Peters Way and Candy Hill Road intersection should be separated by a minimum of 267 feet whereas they are separated by approximately 120 ft. Therefore drivers must simultaneously process conflicts at the Candy Hill Road intersection and the Peters Way Extension intersection. The close spacing of these intersections increases the complexity of driver decisions and compromises safety.

Vehicle queues at the Hudson Road/Concord Road/Old Sudbury Road Intersection regularly extend north on Concord Road through the Peter's Way and Candy Hill Road intersections. Queued vehicles restrict sight distance for vehicles exiting the site and for drivers looking toward these exiting vehicles from Concord Road. These sight distance limitations compromise safety and may cause vehicle crashes.

Locating a principal project entrance diagonally opposite Candy Hill Road results in trips generated by the "Submitted Project" using the Candy Hill Road, Plympton Road, and Water Row alternative route ("Alternative Route") to access points on Route 27 east of Water Row. The roads along the "Alternative Route" are low speed rural country roads unsuited to accommodate though traffic. Candy Hill Road and Plympton Road in particular have segments

where pavement widths are so narrow that it is necessary for opposing vehicles to slow, stop, and even pull off the pavement in order to pass.

The Primary Site Drive/Hudson Road Intersection is also impacted by queued vehicles that restrict sight distance and potentially increase vehicle crashes.

Cut-through traffic is a major concern. Given the delays experienced at the Hudson Road/Concord Road/Old Sudbury Road Intersection during peak traffic hours, it is quicker to cut through the site than to use Concord Road and Hudson Road for north-eastbound and south-westbound trips. The on-site drives are ill suited to accommodate through traffic and no resolution of this problem was reached during the Zoning Board of Appeals hearing process.

Eliminating the need to construct the Peter's Way and Concord Road Intersection and elimination of this intersection is in itself a key measure to minimize and mitigate traffic impacts for this alternative. The key concerns of sight distance restrictions by queued vehicles, the close spacing of the Peter's Way and Candy Hill Road Intersections, and generating traffic on Candy Hill Road, Plympton Road, and Water Row are resolved by elimination of this intersection.

In addition, the reduced trip generation with the “Approved Townhouse Project” is highly effective in minimizing and mitigating traffic impacts at all intersection locations in the Transportation Study Area.

Traffic Impact mitigation proposed by the “Applicant” for the “Submitted Project” is limited to installation of a flashing warning beacon at the Peckham Road/Hudson Road Intersection. No measures are proposed to minimize or mitigate impacts associated with use of Peter's Way and Concord Road Intersection as a major entrance. No measures are proposed to minimize or mitigate construction phase traffic impacts and no measures are offered to minimize or mitigate permanent traffic impacts by an effective Transportation Demand Management Plan.

2. INTRODUCTION

2.1. PROJECT DESCRIPTION

The Sudbury Station Comprehensive Permit 40B Project (“Proposed Project”) is a residential rental project submitted to the Sudbury Zoning Board of Appeals by Sudbury Station, LLC (“Applicant”). The “Proposed Project” is located on an approximately 13.4 acre portion of a larger tract of land, the remainder of which is restricted from development. The “Proposed Project” is located northwest of the Concord Road and Old Sudbury Road/Hudson Road Intersection to the west of the Town Cemetery in Sudbury’s Historic District. Professional Services Corporation, PC (PSC) was engaged by the Town of Sudbury to prepare this Transportation Impact Assessment (TIA) addressing the impacts of two alternatives, the 30-Unit Approved Townhouse Project Alternative (“Approved Townhouse Project”) and the 250-unit Submitted Project Alternative (“Submitted Project”).¹

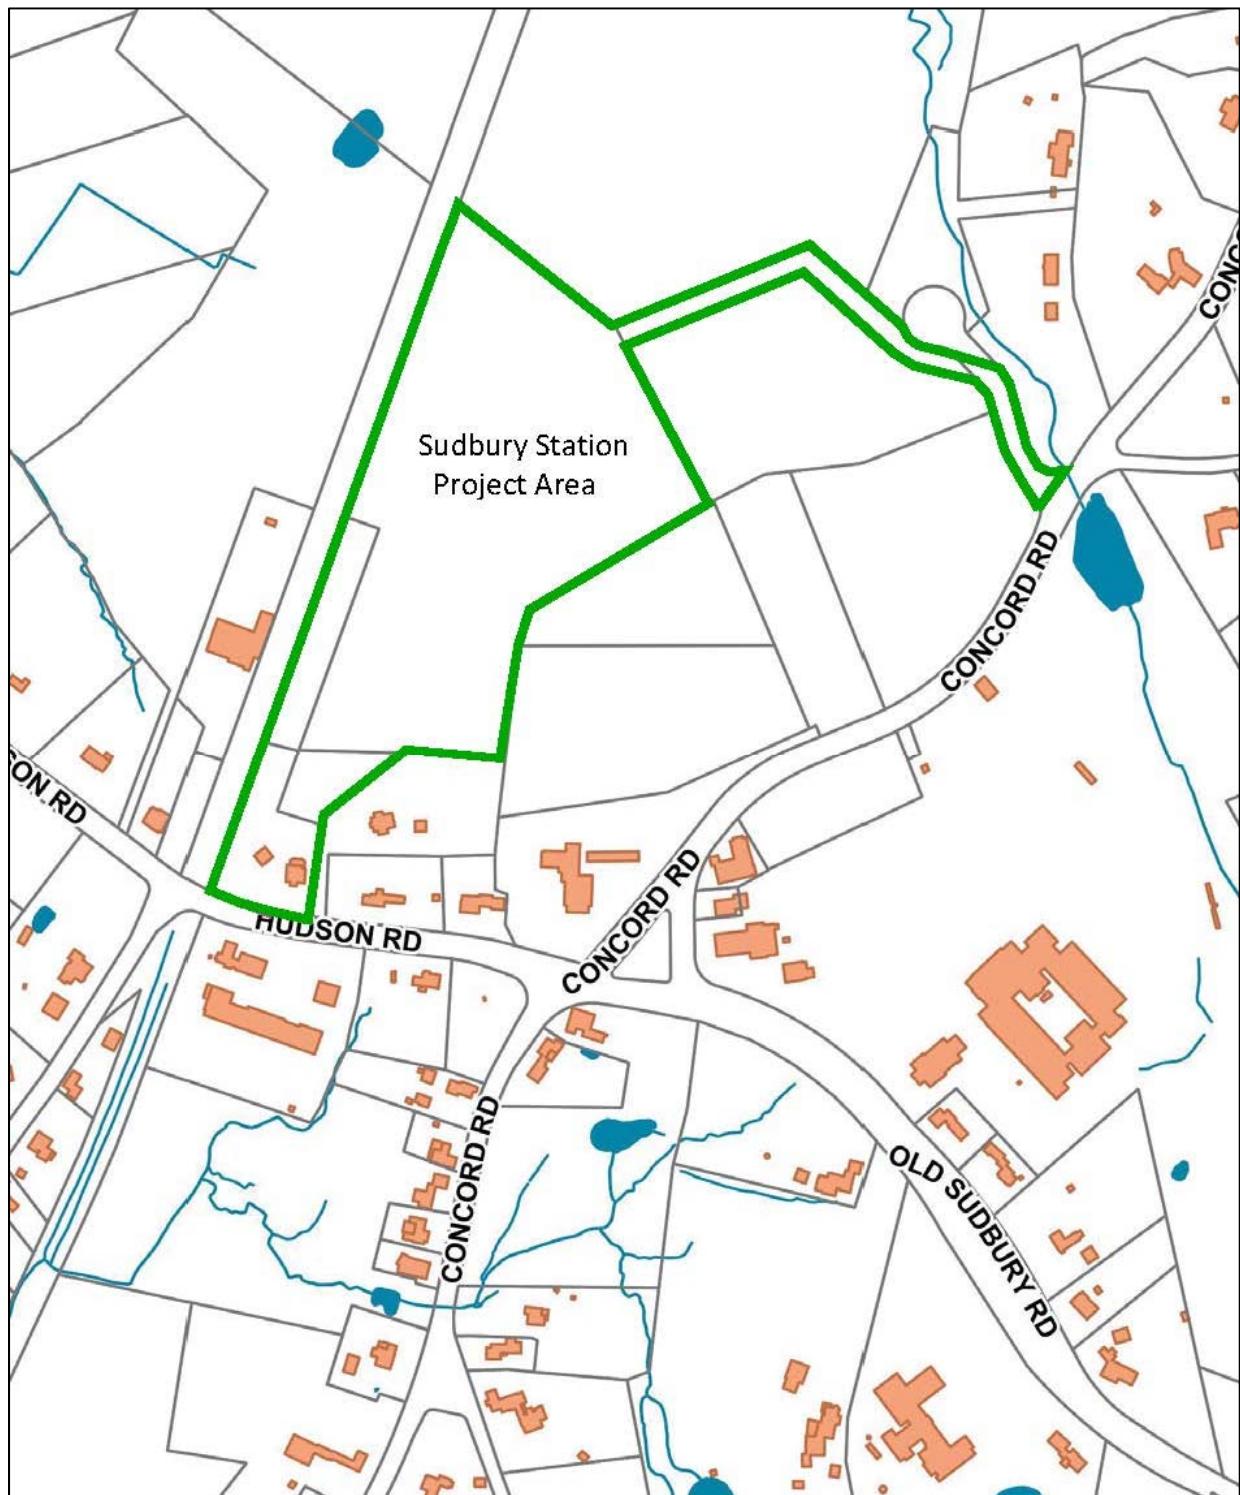

The “Approved Townhouse Project” is a 30 unit rental project approved by the Sudbury Zoning Board of Appeals by Decision dated September 20, 2016 (“Decision”). As required by the “Decision,” the development is served by a single two-lane, two-way primary access drive that intersects with Hudson Road east of Peakham Road. Each townhouse would have a garage parking space and a driveway parking space. Visitor parking would be available along the primary access drive.

The “Submitted Project” is a 250 unit rental project that includes 36 townhouses and 214 units in mid-rise buildings as well as a clubhouse for project residents. The project is served by two entrances, one on Hudson Road and one connecting to Concord Road via a newly constructed Peter’s Way.

2.2. LOCUS

As shown in Figure 2.2-1, the “Proposed Project” is located in Sudbury, Massachusetts north of Hudson Road and west of Concord Road.

¹ Site Plans dated January 25, 2016 and last revised July 14, 2016 prepared by Sullivan, Connors & Associates containing 9 sheets plus a stormwater design sheet.

Locus: Figure 2.2-1

2.3. PRIOR TRAFFIC IMPACT AND ACCESS STUDY

The traffic impacts of the Sudbury Station Comprehensive Permit (40B) were previously evaluated in the “Traffic Impact and Access Study, The Village at Sudbury Station 40B Development, Hudson Road, Sudbury, Massachusetts, Prepared for Sudbury Station, LLC, December 2015” prepared by MDM Transportation Consultants, Inc. (“Submitted TIAS”), that was submitted to the Sudbury Zoning Board of Appeals as part of the Comprehensive Permit Application. This TIAS evaluated the 250 unit “Submitted Project” only. It did not evaluate the “Approved Townhouse Project”. This TIA evaluates the impacts of both the “Approved Townhouse Project” and the “Submitted Project”.

Approximately three and one half years have passed since the traffic counts were taken for the “Submitted TIAS” (December 2014 vs May 2018) and traffic volumes change and commonly increase over time. The “Submitted TIAS” used a 5 year planning horizon and evaluated future 2020 No-Build conditions and 2020 Build Conditions. In accordance with the MassDOT Transportation Impact Assessment (TIA) Guidelines (March 13, 2014), this TIA uses a 7 year planning horizon and evaluates future 2025 No-Build and 2025 Build conditions. The “Submitted TIAS” adjusted the counted traffic volumes to 2020 using a growth factor of 0.5% per year for 5 years. Based upon analysis of traffic volume changes at representative MassDOT permanent counting stations, this TIA uses a growth factor of 1.5% per year for 7 years.

Since the “Submitted TIAS”, reconstruction of the Hudson Road/Concord Road/Old Sudbury Road Intersection has been completed. The new traffic signal system at the Hudson Road/Concord Road/Old Sudbury Road Intersection provides an exclusive pedestrian phase. The Highway Capacity Manual (HCM) analysis in the “Submitted TIAS”, did not analyze an exclusive pedestrian phase.

Since the “Submitted TIAS”, the National Academies, Transportation Research Board (TRB) published the Highway Capacity Manual, Sixth Edition: A Guide for Multimodal Mobility Analysis (HCM) used in preparing this TIA. The Institute of Transportation Engineers (ITE) has published the Institute of Transportation Engineers, Trip Generation Manual, 10th Edition, September 2017 used in preparing this TIA.

2.4. SITE PLANS

The site plan shown in Figure 2.4-1 was developed by PSC on behalf of the Town of Sudbury to depict the “Approved Townhouse Project” which complies with all the Conditions of Approval of the Zoning Board of Appeals’ “Decision” on the Comprehensive Permit.

The “Townhouse Plan” provides for 30 townhouses in buildings that comply with the height and setback requirements of the Sudbury Zoning Bylaw. In addition to the new townhouse buildings, the Gilmartin residence on Hudson Road would remain on-site.

The “Approved Townhouse Plan” is served by a single two-lane, two-way primary access drive that intersects with Hudson Road east of Peakham Road. The Primary Site Drive and Hudson Road Intersection accommodates the trips generated by the 30 townhouses with a single approach lane on the Primary Access Drive. Each townhouse is provided with a garage parking space and a driveway parking space. Visitor parking is available along the Primary Access Drive.

The “Submitted Plan” shown in Figure 2.4-2 was developed by Sullivan, Connors, and Associates on behalf of Sudbury Station, LLC and depicts the “Submitted Project.” It was submitted to the Sudbury Zoning Board of Appeals by the “Applicant” as part of the Comprehensive Permit Application.

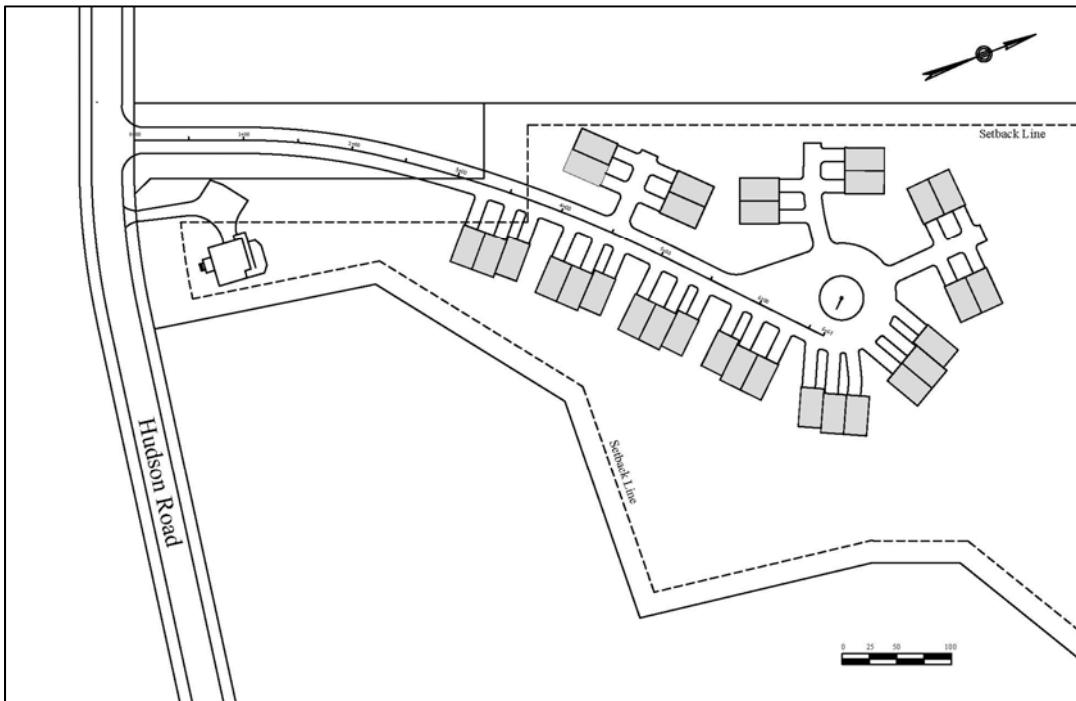

The “Submitted Project” provides five townhouse buildings, 4 buildings with 7 townhouses and 1 building with 8 townhouses. It also provides 5 mid-rise multifamily buildings, 2 buildings with 33 units, 1 building with 44 units and 2 buildings with 52 units. Additionally, the “Submitted Plan” includes a clubhouse, a wastewater treatment facility, and a maintenance building. For the “Submitted Plan”, 2 entrances are provided, 1 entrance on Hudson Road nearly opposite Peakham Road where a new driveway with two approach lanes will be constructed and 1 entrance on Concord Road nearly opposite Candy Hill Road where the currently unconstructed Peter’s Way will be fully constructed. On-site parking totaling 494 parking spaces is provided for the “Submitted Project” that includes 256 garage parking spaces (including 10 accessible parking spaces) and 238 at grade parking spaces (including 14 accessible parking spaces).

3. ANALYTICAL PROCEDURES

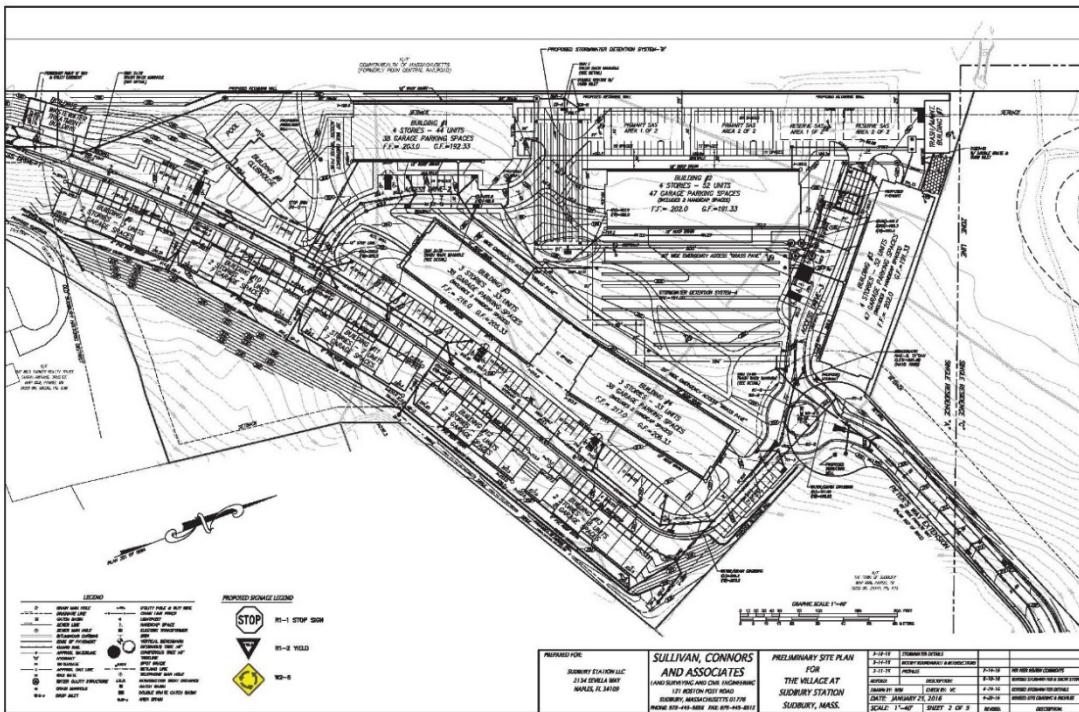

This Transportation Impact Assessment was developed in compliance with MassDOT’s Transportation Impact Assessment (TIA) Guidelines and standard engineering practice. Turning movement count data was obtained for all study intersections for the weekday morning and evening peak hours on a “typical” Thursday when school was in session. Automatic Traffic Recorder count data with vehicle classifications and speeds was obtained on the same Thursday. Signalized intersection capacity analysis and two-way stop controlled intersection capacity analyses were analyzed using Synchro plus Sim Traffic 10 (10.2.2.0.45) by Trafficware. MassDOT permanent counting statin data was used to analyze seasonal adjustment requirements. Trip generation was forecast using Institute of Transportation Engineers, Trip Generation Manual, 10th Edition, September 2017 © 2017. Origins and destination of vehicle trips is based on US Census Journey to Work data and traffic assignment is based on minimization of travel time.

Transportation Impact Assessment
Development Alternatives for Sudbury Station
Comprehensive Permit (40B) Project
Sudbury, Massachusetts

Approved Townhouse Plan: Figure 2.4-1

Submitted Plan: Figure 2.4-2

4. TRANSPORTATION STUDY AREA

The Transportation Study Area (TSA) includes intersections in proximity to the Project Site most directly impacted by trips generated by the “Proposed Project” as follows:

- Hudson Road/Concord Road/Old Sudbury Road Intersection
- Peakham Road/Hudson Road Intersection
- Concord Road/Candy Hill Road Intersection
- Hudson Road/Primary Site Drive Intersection
- Peter’s Way/Concord Road Intersection

5. EXISTING CONDITIONS ASSESSMENT

5.1. ROADWAY NETWORK

5.1.1. ROADWAY SEGMENTS

Old Sudbury Road and Hudson Road are east-west oriented segments of Route 27 and are in local jurisdiction. Route 27 is a two-way two-lane roadway. The roadway serves the Noyes School, and retail, and residential land uses.

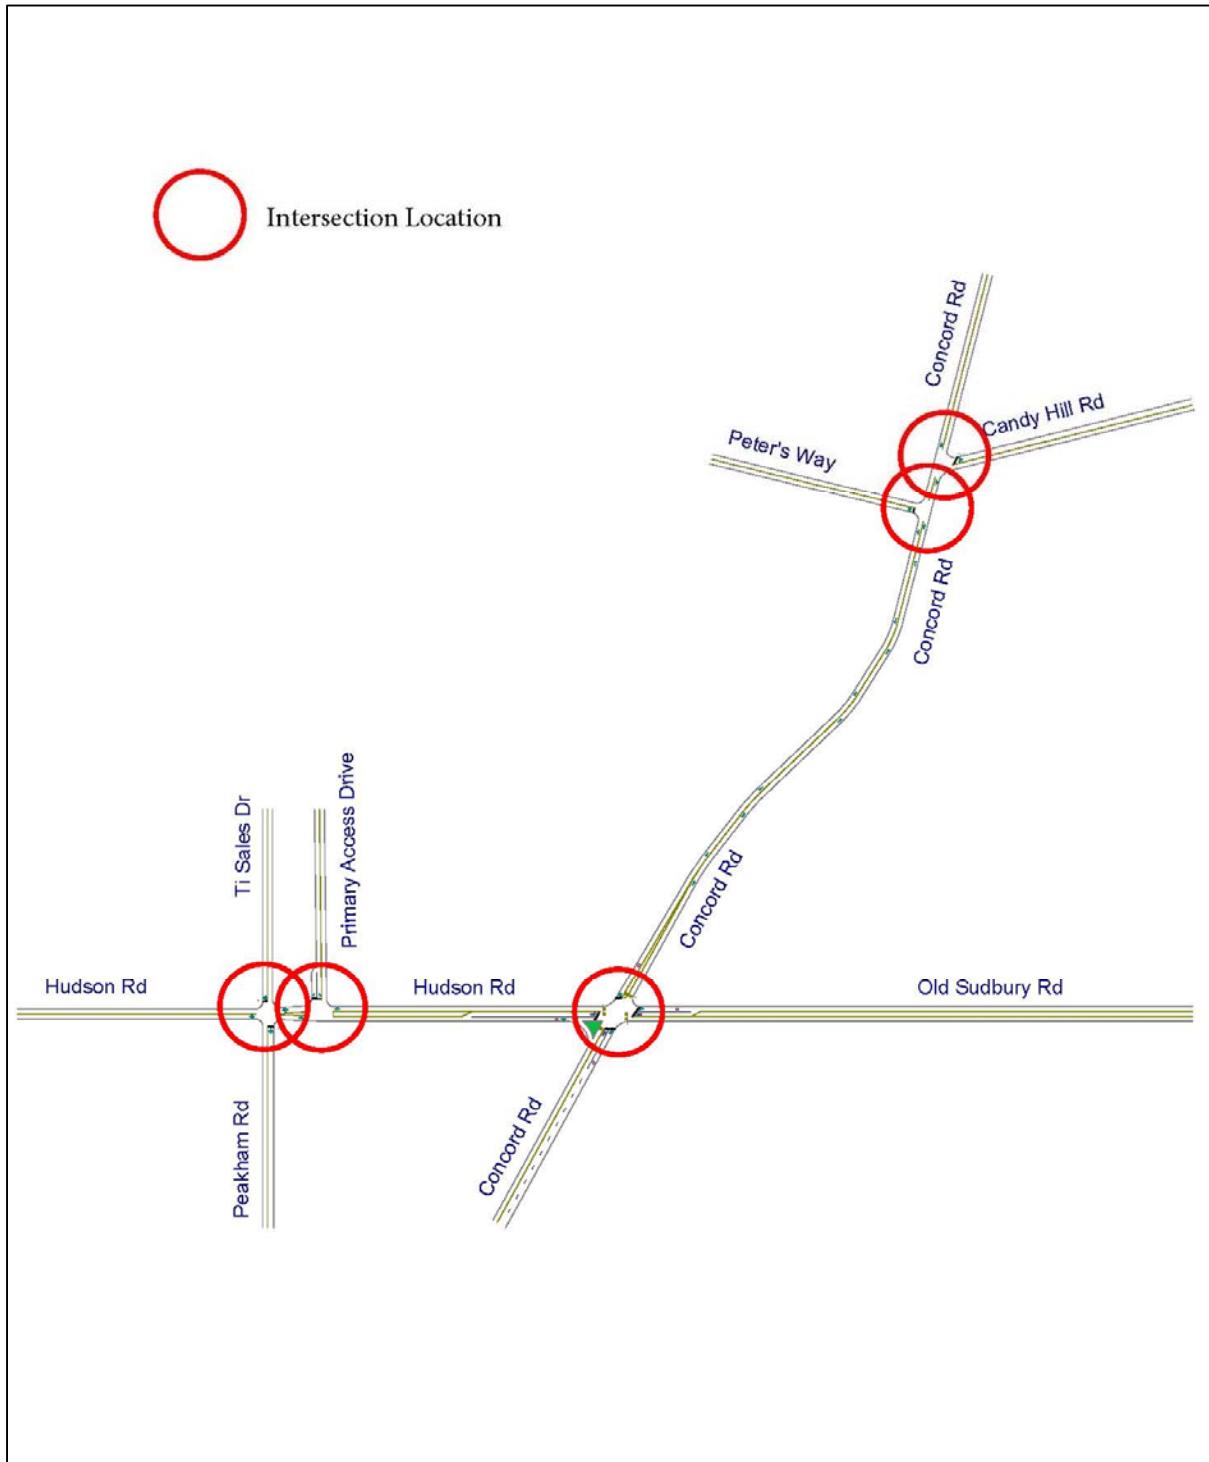

Concord Road is a north-south oriented roadway in local jurisdiction. Concord Road is a two-way two-lane roadway extending north and south of Route 27. The roadway serves an entrance to the Town Hall complex, retail, and residential land uses.

Peakham Road is a north-south oriented roadway in local jurisdiction. Peakham Road Concord Road is a two-way two-lane roadway. The roadway serves retail and residential land uses.

Candy Hill Road/Plympton Road/Water Row is a route running easterly, south westerly, and southerly connecting Concord Road with Old Sudbury Road (Route 27). These roadways are nominally two-way, two-lane roadways; however, segments of Candy Hill Road and Plympton Road are narrow and passenger vehicles must slow, stop, or pull off the pavement in order to pass. These restrictions would be even more severe for trucks.

5.1.2. INTERSECTIONS

The Hudson Road/Concord Road/Old Sudbury Road Intersection is a four-way intersection operating under signal control and is under Town jurisdiction. In addition to the four intersection legs, there is a turning roadway connecting Old Sudbury Road with Concord Road north of Route 27. This two-lane, two-way turning roadway serves an entrance to the

Transportation Study Area: Figure 4-1

Town Hall complex and allows southbound left turning vehicles and westbound right turning vehicles to bypass the center of the intersection. The intersection was recently reconstructed to improve operations and safety. The eastbound Hudson Road approach has an exclusive left turn lane, a through lane and a channelized turning roadway for right turns. The westbound Old Sudbury Road approach has a left turn lane and a through/right lane although right turns are negligible due to the availability of the turning roadway. The southbound approach on Concord Road has a single lane approach. Left turns are negligible due to the availability of the turning roadway. The northbound approach on Concord Road has a left turn lane and a through/right lane. There are crosswalks on the south side of Route 27 across Concord Street and on the east side of Concord Road across Old Sudbury Road. Signal timing was observed to operate based on recommended signal timing provided by the Town's consultant.

The Peakham Road/Hudson Road Intersection is a four way stop controlled intersection whose southbound approach is the private Ti-Sales industrial driveway. All legs have single lane approaches. The northbound approach on Peakham Road and the southbound approach on the Ti-Sales driveway operate under stop control. There is a crosswalk on the south side of Hudson Road across Peakham Road.

The Concord Road/Candy Hill Road Intersection is a two-way stop controlled intersection with single lanes on all approaches. The eastbound approach on Candy Hill Road operates under stop control. There is a crosswalk south of Candy Hill Road across Concord Road serving the walkway from the Town Hall complex.

5.2. PEDESTRIAN FACILITIES

Pedestrian facilities are limited and discontinuous within the TSA. Sidewalks along Route 27 extend approximately 600 ft. east of Concord Road on Old Sudbury Road. Between Peakham Road and Concord Road, there is an approximately 800 ft. long pedestrian path on a separate alignment south of Hudson Road. A sidewalk continues on Hudson Road west of Peakham Road.

There are short segments of sidewalk on Peakham Road and on Concord Road south of Route 27 while the remainder of these roadways do not have pedestrian facilities. On Concord Road north of Route 27, there is walkway on a separate alignment along the east side of Concord Road between the town complex and Candy Hill Road while there are no sidewalks on the remaining segments of Concord Road in the TSA. There are no sidewalks along Candy Hill Road, Plympton Road, or Water Row.

5.3. PUBLIC TRANSPORTATION

5.3.1. COMMUTER RAIL

The Town of Sudbury is served by the MBTA Fitchburg commuter rail line. The nearest commuter rail station is Lincoln which is 5.7 miles from the project site and provides 161 parking spaces available for a daily fee. Lincoln is in fare zone 4 and is serviced by 17 inbound and 17 outbound trains per day. Future residents off the project area are expected to use Concord Road and either Route 126 or Route 117 to reach the Lincoln commuter rail station. Future project residents would not be expected to use the Worcester-Framingham commuter rail line as the nearest stations on the Worcester Framingham commuter rail line, Framingham, Natick, and West Natick are approximately 9 or more miles distant.

5.3.2. CONNECTIVITY

Residents primarily use private automobile or carpool modes to travel between the TSA and the MBTA commuter rail.

5.4. VEHICLE TRAFFIC VOLUMES

PSC had automatic traffic recorders placed on Hudson Road east of Peakham Road, on Old Sudbury Road east of Concord Road and on Concord Road south of Candy Hill Road on Thursday, May 24, 2018. PSC had manual turning movement counts taken at the Hudson Road/Concord Road/Old Sudbury Road intersection, at the Peakham Road/Hudson Road intersection, and at the Concord Road/Candy Hill Road intersection from 7:00 AM to 9:00 AM and from 4:00 PM to 6:00 PM on Thursday, May 24, 2018.

Average Daily Traffic Volumes: Table 5.4-1

Hudson Road		11,487	eastbound
east of Peakham Road	21,869		10,382 westbound
Old Sudbury Road		6,466	eastbound
east of Concord Road	12,800		6,334 westbound
Concord Road		6,049	northbound
south of Peter's Way	12,015		5,966 southbound

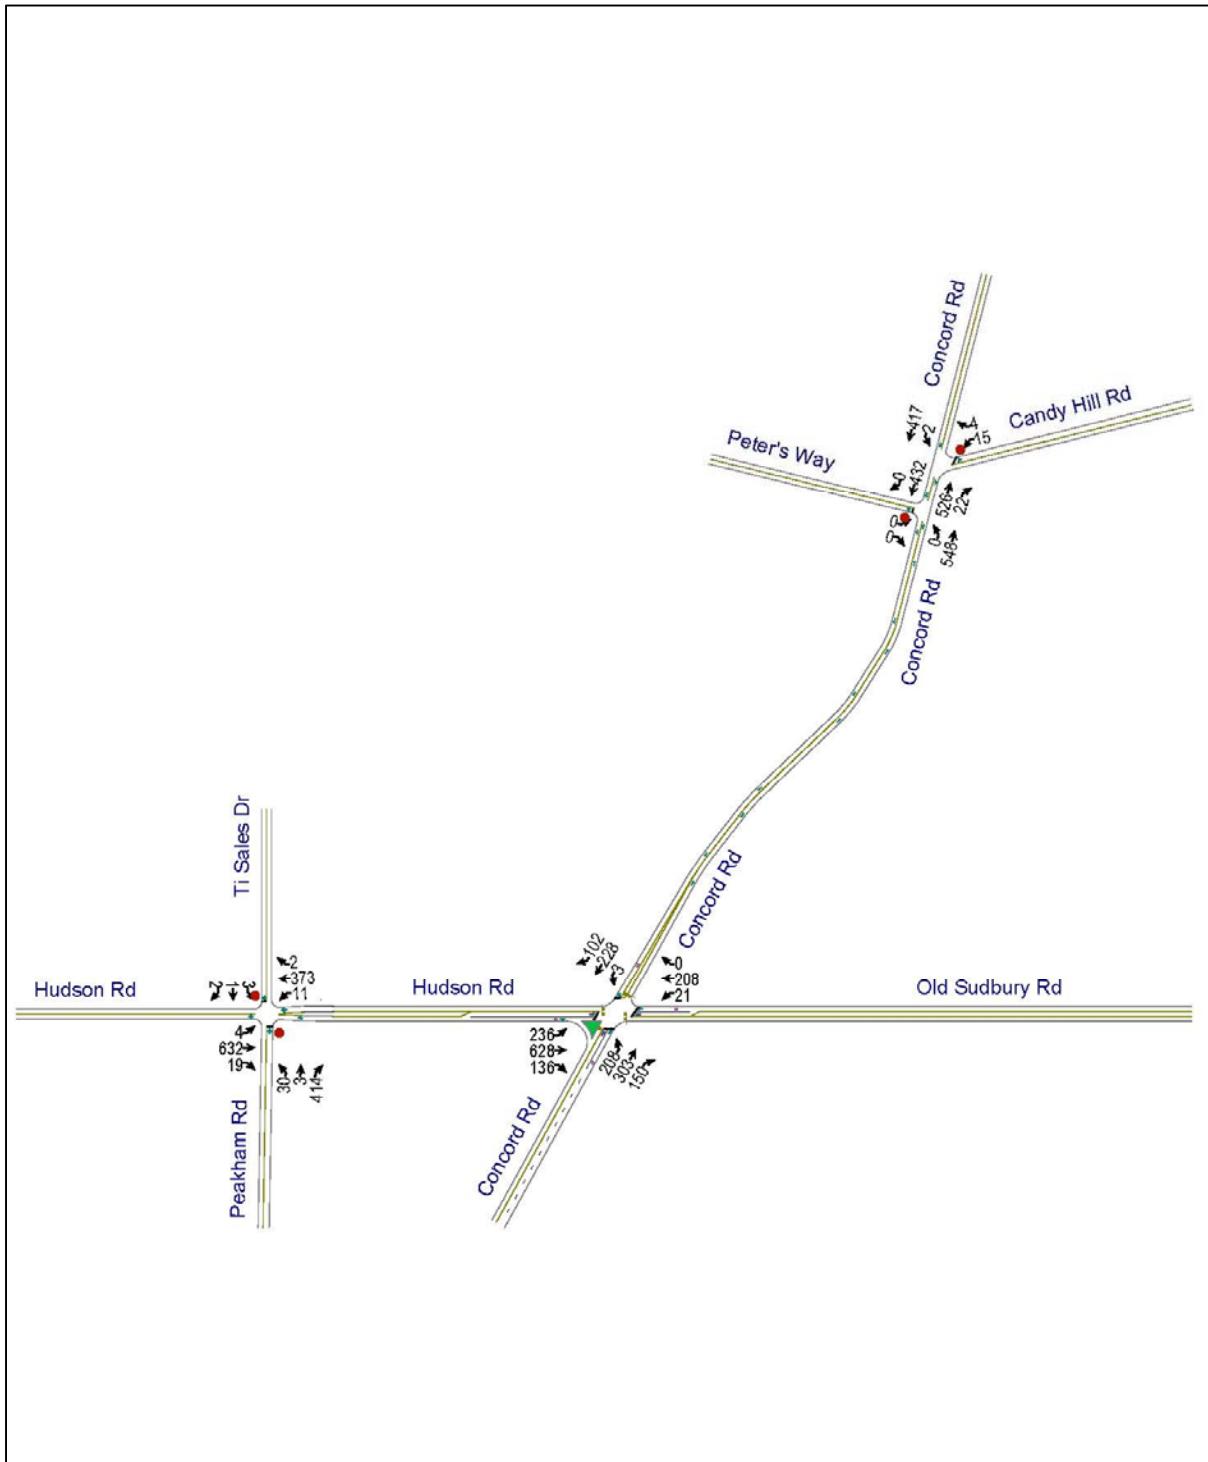

Twenty Four Hour Traffic Volumes. On Hudson Road east of Peakham Road, the 24 hour volume was counted as 21,869 (52.5% eastbound, 47.5% westbound) of which 0.6% were busses and 4.2% were trucks (vehicles with 6 or more wheels). The bidirectional morning peak hour volume 1,362 ($K=0.06$) occurred for the hour beginning at 6:15 AM and the bidirectional evening peak hour volume 1,703 ($K=0.08$) occurred for the hour beginning at 4:00 PM. Volumes are heavier (69%) eastbound before noon and are heavier (57%) westbound after noon. The 50th percentile speed eastbound was 21 miles per hour (mph) and the 85th percentile speed was 31 mph. The 50th percentile speed westbound was 27 miles per hour (mph) and the 85th percentile speed was 32 mph.

On Old Sudbury Road east of Concord Road, the 24 hour volume was counted as 12,800 (50.5% eastbound, 49.5% westbound) of which 0.5% were busses and 4.3% were trucks (vehicles with 6 or more wheels). The bidirectional morning peak hour volume 1,088 ($K=0.09$) occurred for the hour beginning at 7:00 AM and the bidirectional evening peak hour volume 933 ($K=0.07$) occurred for the hour beginning at 4:00 PM. Volumes are heavier (68%) eastbound before noon and are heavier (65%) westbound after noon. The 50th percentile speed eastbound was 30 miles per hour (mph) and the 85th percentile speed was 35 mph. The 50th percentile speed westbound was 26 miles per hour (mph) and the 85th percentile speed was 33 mph.

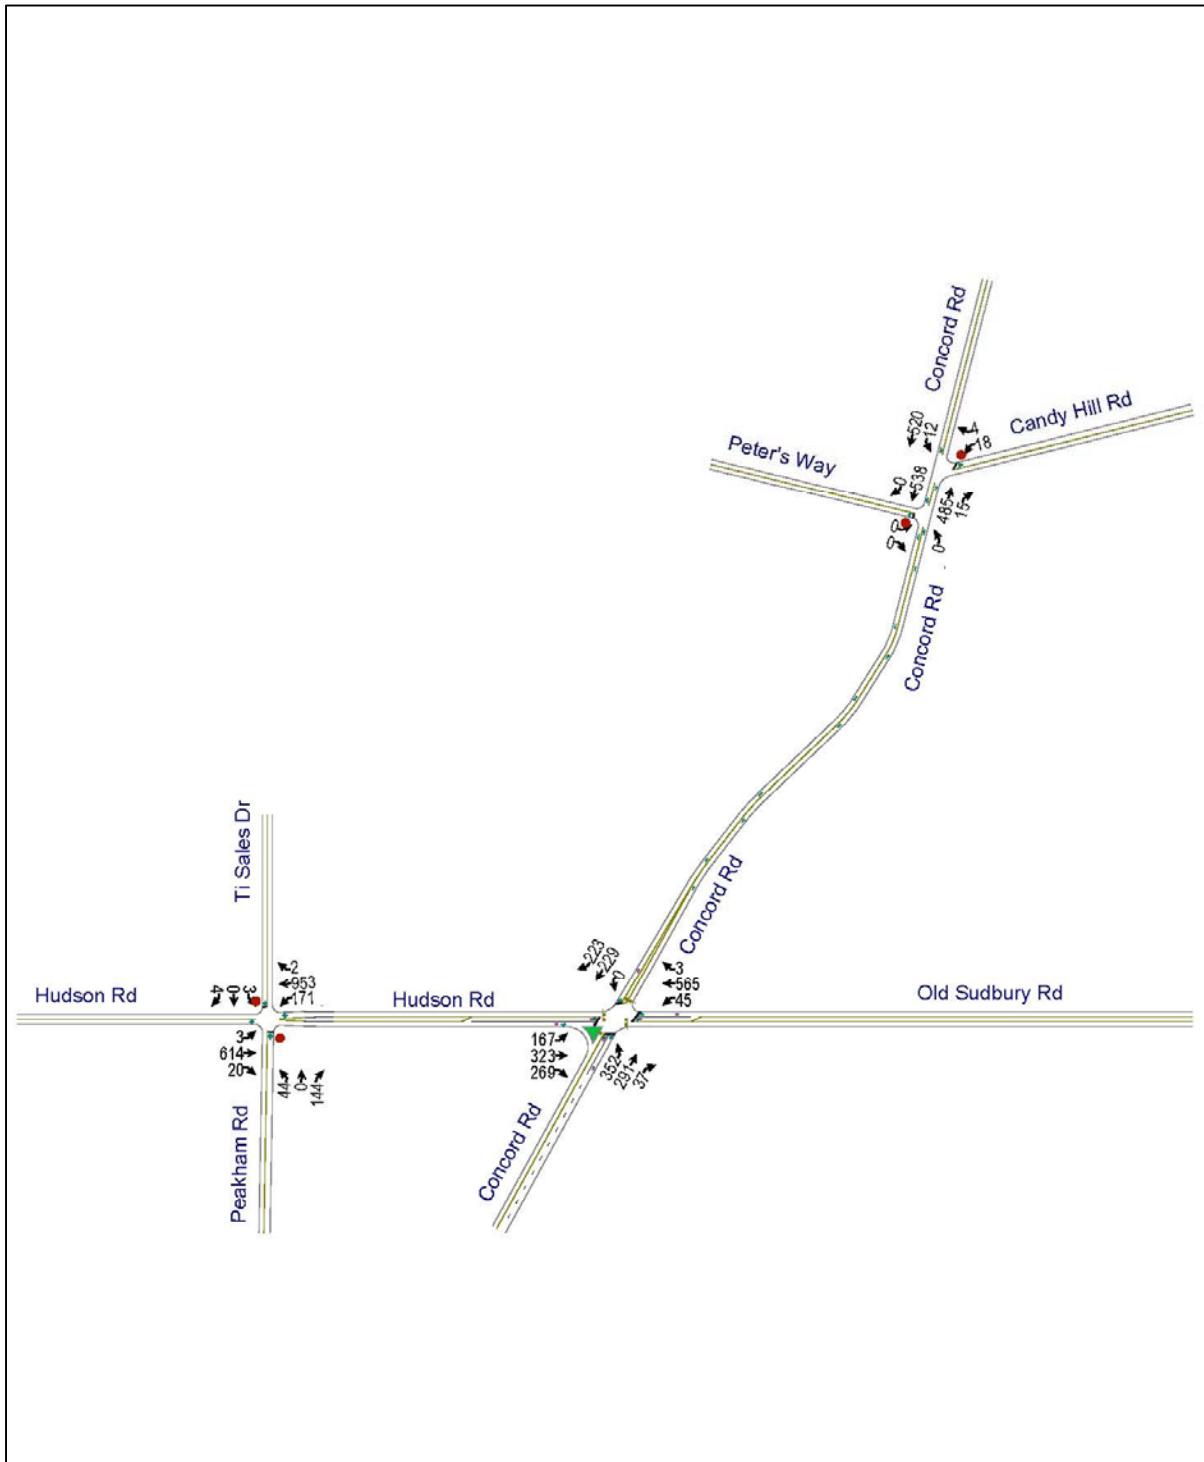

On Concord Road south of Peter's Way, the 24 hour volume was counted as 12,015 (50.3% northbound, 49.7% southbound) of which 1.2% were busses and 3.6% were trucks (vehicles with 6 or more wheels). The bidirectional morning peak hour volume 1,077 ($K=0.09$) occurred for the hour beginning at 9:00 AM and the bidirectional evening peak hour volume 963 ($K=0.08$) occurred for the hour beginning at 4:45 PM. Volumes are heavier (57%) northbound before noon and are heavier (54%) southbound after noon. The 50th percentile speed northbound was 33 miles per hour (mph) and the 85th percentile speed was 37 mph. The 50th percentile speed southbound was 29 miles per hour (mph) and the 85th percentile speed was 35 mph.

The 2018 Existing Morning Peak Hour Traffic Volumes and the Existing Evening Peak Hour Traffic Volumes based upon the May 24th manual turning movement counts are shown in Figures 5.4-1 and 2.4-2.

PSC evaluated Average Daily Traffic (ADT) data available through the MassDOT Transportation Data Management System at locations representative of traffic conditions in Sudbury. During

2018 Existing Weekday AM Peak Hour Traffic Volumes: Figure 5.4-1

2018 Existing Weekday PM Peak Hour Traffic Volumes: Figure 5.4-2

2017, ADT volumes for the month of May were higher than the Average Annual Daily Traffic (AADT) volume at all stations. To be conservative, the counted volumes were not decreased.

5.5. SAFETY ANALYSIS

As shown in Table 5.5-1, the calculated vehicle crash rates for the most recent 5-year period available, 2012 through 2016, at the Hudson Road/Concord Road/Old Sudbury Road Intersection, Peakham Road/Hudson Road Intersection, and Concord Road/Candy Hill Road Intersection are comparable to but just below the statewide crash rates for signalized and unsignalized intersection respectively.

Vehicle Crash Data for the Years 2012 through 2016: Table 5.5-1

	Hudson Rd./ Concord Rd./ Old Sudbury Rd. Intersection	Peakham Rd./ Hudson Rd. Intersection	Concord Rd./ Candy Hill Rd. Intersection
	<u>Signalized</u>	<u>Unsignalized</u>	<u>Unsignalized</u>
Crash Rate	0.68	0.34	0.48
Statewide Average Crash Rate	0.78	0.57	0.57
District 3 Average Crash Rate	0.89	0.61	0.61
Crashes			
2012	5	4	3
2013	6	2	3

4:00 to 6:00 PM	5	5	3
Balance of Day	23	5	7

5.6. OPERATIONS ANALYSIS

Intersection operations are described in terms of level-of-service which range from A to F. The level-of-service criteria for unsignalized intersections are different than those for a signalized intersection. The primary reason is that drivers expect different levels of performance at signalized and unsignalized intersections.

Level of service for signalized intersections is defined in terms of control delay for the total intersection. LOS criteria for traffic signals are stated in term of the average control delay per vehicle. Levels-of-service range from A to F and are defined to represent reasonable ranges in control delay as follows:

Level-of-service Criteria for Signalized Intersections: Table 5.6-1

Level-of-Service	Control Delay per Vehicle (sec./vehicle)
A	≤10
B	>10 to 20
C	>20 to 35
D	>35 to 55
E	>55 to 80
F	>80

Level of service (LOS) for an unsignalized two-way stop-controlled intersection (TWSC) intersection is determined by the computed or measured control delay and is defined for each minor movement. LOS is not defined for the intersection as a whole. LOS criteria for unsignalized TWSC intersections are as follows:

Level-of-Service Criteria for Two-Way Stop Controlled Intersections: Table 5.6-2

Level-of-service	Average Control Delay (sec./vehicle)
A	≤ 10
B	>10 to 15
C	>15 to 25
D	>25 to 35
E	>35 to 50
F	>50

As shown in Table 6.5-1 with the 2018 Existing Traffic Volumes, the signalized Hudson Road/Concord Road/Old Sudbury Road Intersection operates at capacity for the overall intersection during the weekday AM peak hour ($v/c = 1.14$, LOS E, $D=74$ sec.).² The intersection is characterized by unacceptable delays for the overall intersection during the weekday PM peak hour ($v/c = 1.04$, LOS F, $D=96$ sec.).

As shown in Table 6.5-3 with the 2018 Existing Traffic Volumes, the unsignalized Peckham Road/Hudson Road Intersection operates with unacceptable delays based on the minor approach (Peckham Road northbound) during the weekday AM peak hour ($v/c = 3.57$, LOS F, $D=\$1287$ sec.). The intersection also operates with unacceptable delays based on the minor approach during the weekday PM peak hour ($v/c = 9.91$, LOS F, $D=4300$ sec.).

The unsignalized Concord Road/Candy Hill Road Intersection operates at level-of-service C based on the minor approach (Candy Hill Road eastbound) during the weekday AM peak hour ($v/c = 0.145$, LOS C, $D=22$ sec.). The intersection also operates with unacceptable delays based on the minor approach during the weekday PM peak hour ($v/c = 0.117$, LOS C, $D=18$ sec.).

5.7. QUEUE LENGTH ANALYSIS

Vehicle queues with the 2018 Existing AM and PM peak hour volumes are shown in Table 6.6-1.

With the 2018 Existing peak hour volumes, the 50th percentile AM peak hour volumes exceed capacity for the eastbound through lane and the northbound left lane and the 50th percentile PM peak hour volumes exceed capacity for the westbound through/right lane and the southbound approach and the queue is theoretically infinite. The AM 95th percentile AM peak hour volumes exceed capacity for the eastbound through lane and the northbound left turn and through/right lanes and the PM peak hour volumes exceeds capacity for the eastbound left and through lanes, the westbound through/right lane, the northbound left lane and the southbound approach and the queue may be longer than calculated. For both the 50th

² v/c is the volume to capacity ratio, LOS is the level-of-service, D is the control delay

percentile and the 95th percentile peak hour volumes, the actual queues may be longer than shown in Table 6.6-1.

The eastbound approach to the Hudson Road/Concord Road/Old Sudbury Road Intersection has a left-turn lane, 1 through lane, and a channelized free-right lane. The available storage for the through lane is limited by the separation to the Peckham Road/Hudson Road Intersection to the west. Queues longer than 750 feet will block the Peckham Road/Hudson Road Intersection.

With the 2018 Existing peak hour volumes, the 50th percentile AM peak hour queue just reaches 750 ft. The 95th percentile through lane queue is 1,293 ft. during the AM peak hour and 916 ft. during the PM peak hour which causes blockage of the Peckham Road/Hudson Road Intersection preventing vehicles from entering the intersection.

With the 2018 Existing peak hour volumes, the 375 ft. of available storage for the northbound left lane is not sufficient to accommodate the 95th percentile queues of 434 ft. with the AM peak hour peak hour volume and 607 ft. with the peak hour peak hour volume.

6. FUTURE CONDITIONS ASSESSMENT

6.1. GENERAL BACKGROUND GROWTH

Average Daily Traffic data available through the MassDOT Transportation Data Management System at locations representative of background growth in Sudbury were analyzed. During the most recent 5-year period available, 2013 to 2017, traffic volumes increased at approximately 1½% per year. Based on an annual growth rate of 1½%, between 2018 and 2025, we forecast that an 11% total increase in background growth will occur.

6.2. IN-PROCESS DEVELOPMENT

The Bruce Freeman Rail Trail (BFRT) is in development and will ultimately connect Lowell with Framingham. The BFRT will occupy the railroad right-of-way abutting the Project Site to the West. Upon completion, the BFRT will add bicycle and pedestrian trips to the Peckham Road/Hudson Road Intersection and the segment of Hudson Road where the Primary Access Drive will intersect with Hudson Street. This will further complicate a location where numerous vehicular, bicycle, and pedestrian conflicts exist in an area where numerous commercial driveways, the Primary Access Drive, and Peckham Road intersect with Hudson Road.

PSC consulted with the Sudbury Planning and Community Development Department and there are no in-process projects in addition to the BFRT which will affect traffic conditions within the Transportation Study Area.

6.3. 2025 NO-BUILD TRAFFIC VOLUMES

The 2025 No-Build Morning Peak Hour Traffic Volumes and the 2025 No-Build Evening Peak Hour Traffic Volumes are shown in Figures 6.3-1 and 6.3-2. The 2025 No-Build Traffic Volumes are based upon the May 24th manual turning movement counts and an annual growth factor of 1½%.

6.4. 2025 BUILD TRAFFIC VOLUMES

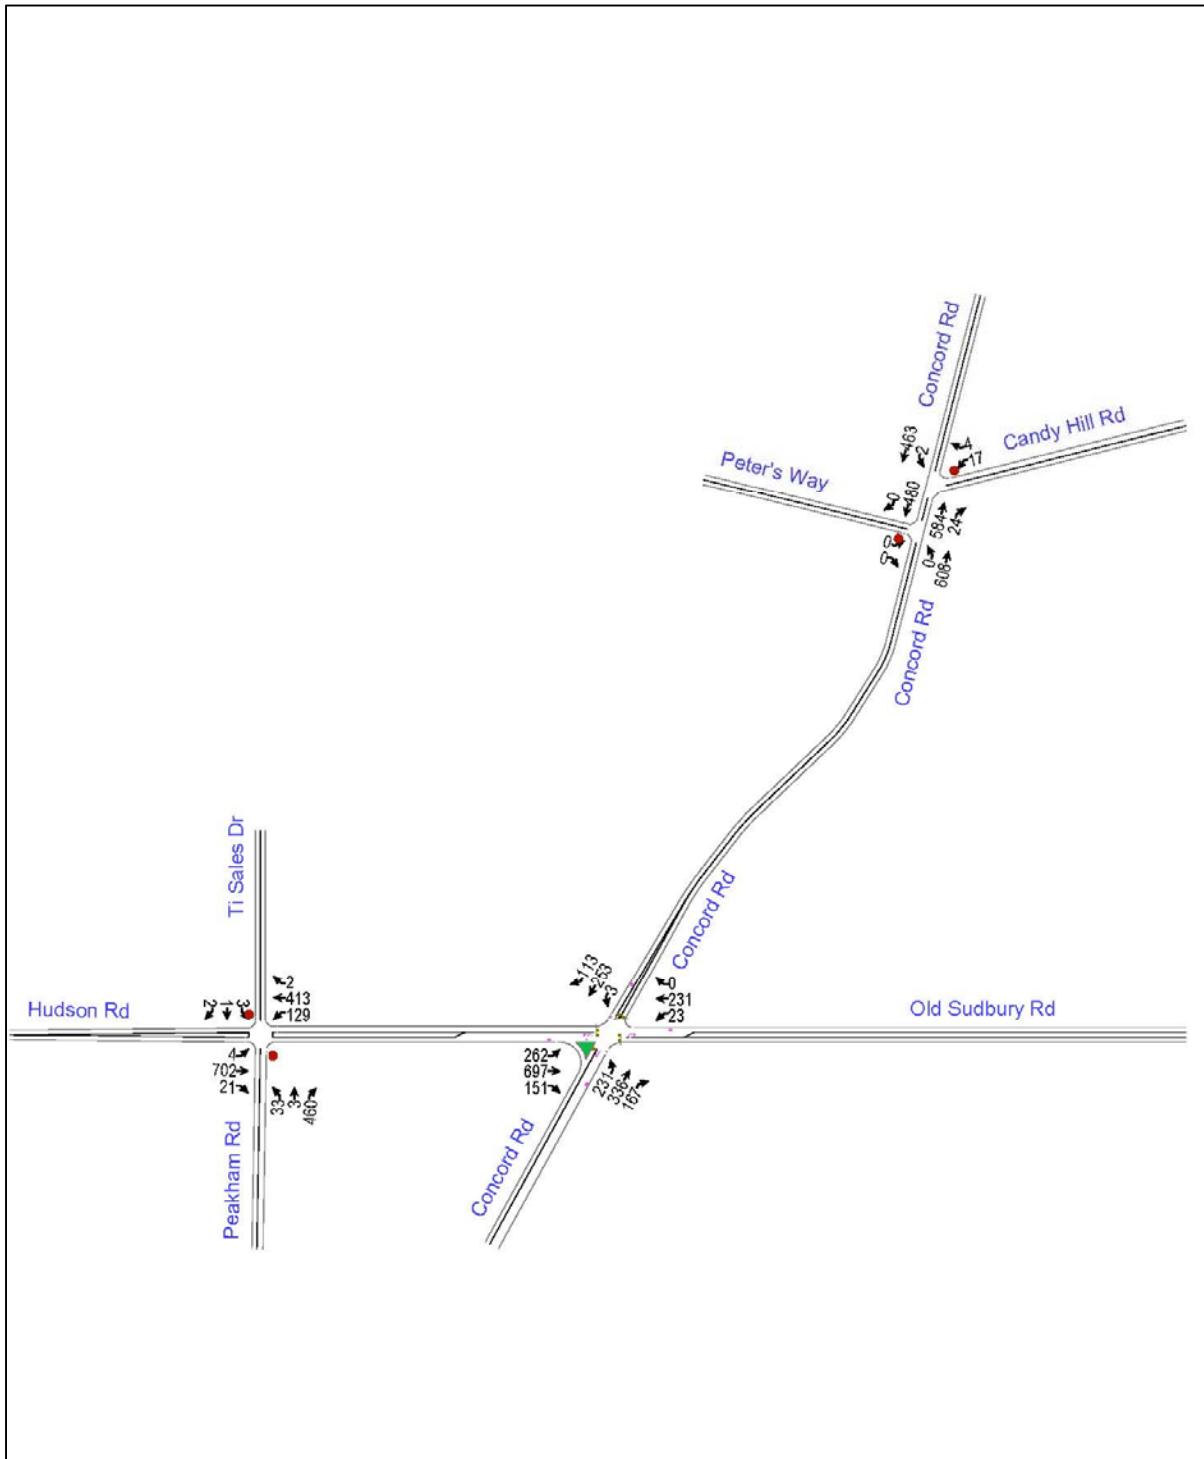

The 2025 Build Traffic Volumes are based on the 2025 No-Build Traffic Volumes and the trips generated by the “Proposed Project.” Trip Generation was forecast using the Institute of Transportation Engineers’ Trip Generation Manual (ITE Trip Generation Manual)³.

US Census of Population, Journey to Work data was used to determine the origins and destinations of peak hour trips generated by the “Proposed Project.” Traffic assignments are based on minimization of travel time using GPS software. However, when an origin or destination can be reached by alternative routes that differ in distance by less than ½ mile or in travel time by less than 1 minutes, assignments are split between the available alternative routes. Based upon this evaluation, 46% of peak hour trips have origins or destinations to the east of the Transportation Study Area. Some 16% of peak hour trips have origins or destinations to the north and 20% have origins or destination to the south of the TSA and these trips are assigned to Concord Road. Additionally, 7% of trips have origins and destinations to the southwest of the TSA and are assigned to Peckham Road and 11 % have origins or destinations to the west of the TSA and are assigned to Hudson Road. Trips generated by the “Proposed Project” are assigned to specific roadways using the percentages shown in Figure 6.4-1.

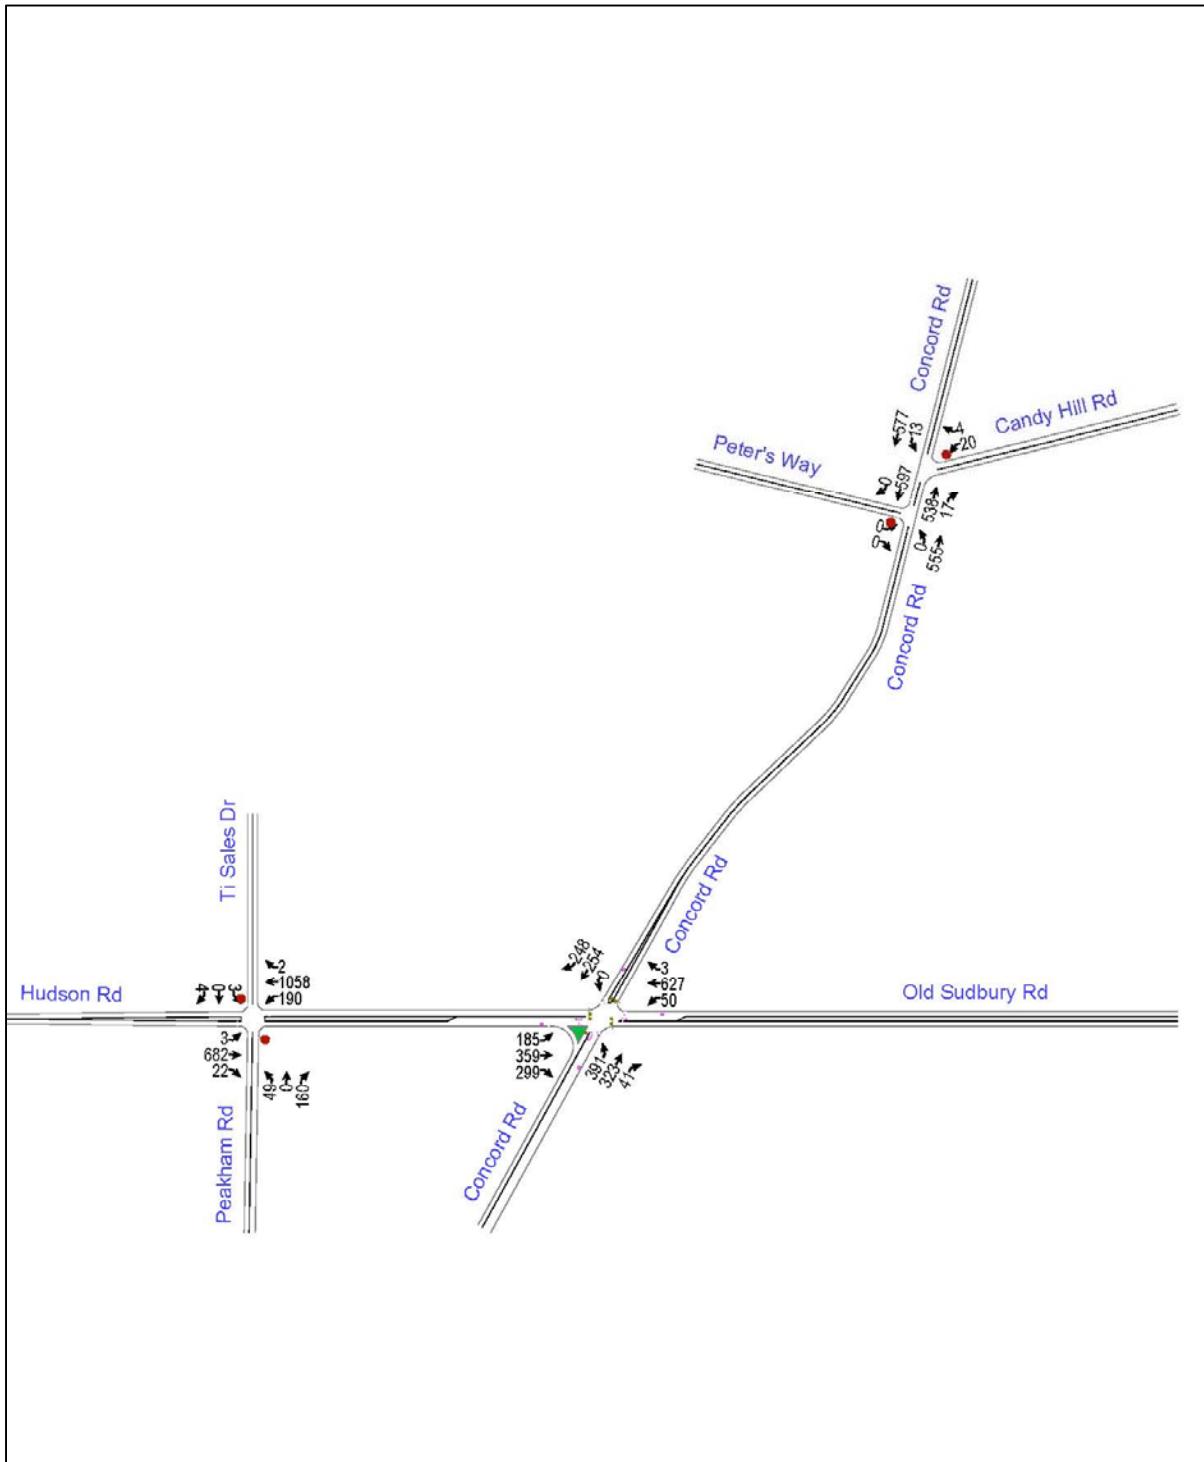

During periods of minimal traffic, trips generated by the “Proposed Project” are assigned to Hudson Road and Old Sudbury Road. During both the weekday morning peak hour and the weekday evening peak hour and extending to other non-peak times of the day, trips assigned to Route 27 experience significant delays due to delay at the Hudson Road/Concord Road/Old Sudbury Road Intersection. Maximum delays are experienced by eastbound traffic during morning peak times and by westbound drivers during evening peak times. The delay is sufficient for drivers to seek alternate routes.

The Candy Hill Road, Plympton Road, and Water Row corridor provides a viable alternate route to avoid the Hudson Road/Concord Road/Old Sudbury Road Intersection. Eastbound trips would be attracted to the Candy Hill Road, Plympton Road, and Water Row route during

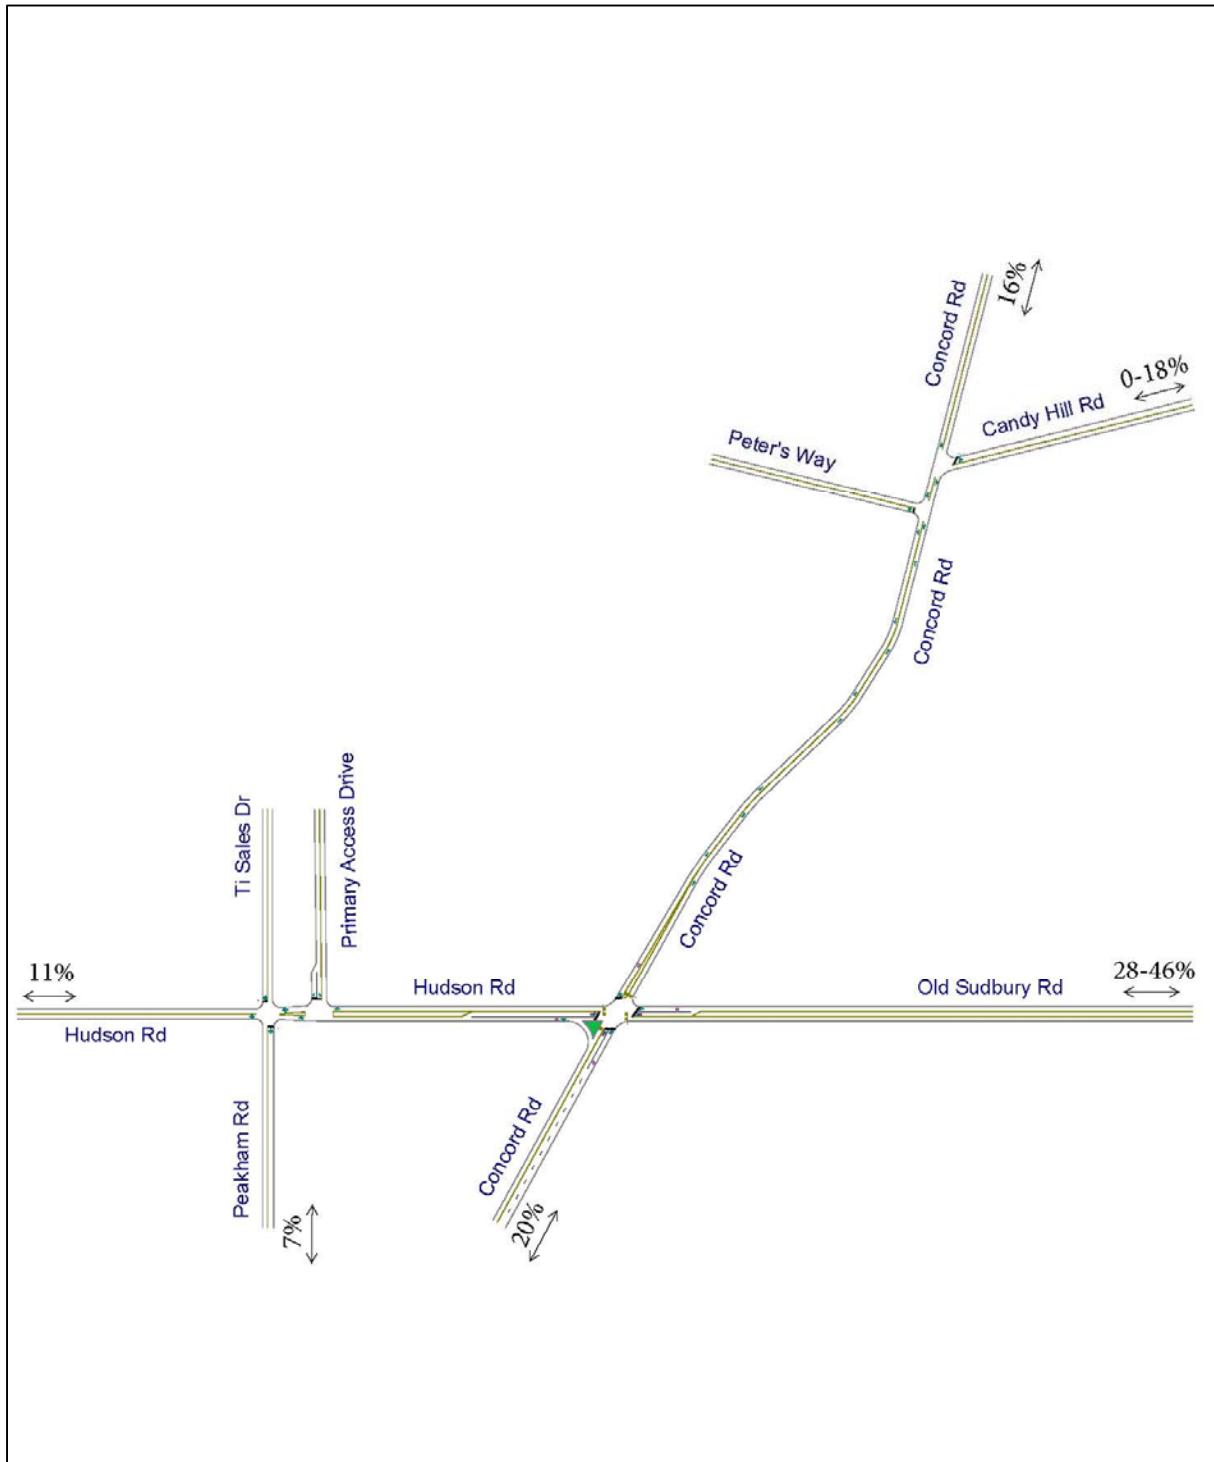

³ Institute of Transportation Engineers, Trip Generation Manual, 10th Edition, September 2017 © 2017

2025 No-Build Weekday AM Peak Hour Traffic Volumes: Figure 6.3-1

2025 No-Build Weekday PM Peak Hour Traffic Volumes: Figure 6.3-2

Traffic Assignment: Figure 6.4-1

morning peak periods and westbound trips would be attracted to the Candy Hill Road, Plympton Road, and Water Row route during morning peak periods. This alternate route would involve use of the Peter's Way and Concord Road Intersection and thus would be most attractive for residents residing in the northerly portions of the Project Site. For trips using the Primary Site

Drive/Hudson Road Intersection, the Candy Hill Road, Plympton Road, and Water Row is not viable because it is still necessary to pass through the Hudson Road/Concord Road/Old Sudbury Road Intersection for both eastbound and westbound trips. Thus the traffic impacts to Candy Hill Road, Plympton Road, and Water Row would occur only with the "Submitted Project" and not with the "Approved Townhouse Project."

On June 7, 2018, PSC staff completed timed travel runs between the Sudbury Station site and the Wayland Country Club located to the east on Route 27. Travel runs using Old Sudbury Road and Hudson Road terminated at the Primary Site Drive/Hudson Road Intersection. Travel runs using Candy Hill Road, Plympton Road, and Water Row terminated at the Peter's Way and Concord Road Intersection. Both drivers used "car following" where possible or otherwise complied with posted speed and speed appropriate for road conditions. As shown in Appendix 6, travel times for eastbound (peak direction) trips in the morning peak period using the two alternative routes differed by 5 seconds, i.e. 5 minutes and 1 second vs. 5 minutes and 6 seconds. Travel times for westbound (peak direction) trips in the evening peak period using the two alternative routes differed by 10 seconds, i.e. 5 minutes and 7 seconds vs. 5 minutes and 17 seconds. With the "Submitted Project," residents in the southerly portion of the Project Site would likely use the Route 27 corridor and residents in the northerly portion of the Project Site would likely use the Candy Hill Road, Plympton Road, and Water Row corridor for trips in the peak direction of traffic flow.

To reflect this condition, during the weekday AM peak hour 18 percent of eastbound trips were assigned to the Candy Hill Road, Plympton Road, and Water Row corridor and 28% were assigned to the Route 27 corridor. All weekday AM peak hour westbound trips continued to be assigned to the Route 27 corridor. In the weekday PM peak hour 18 percent of westbound trips were assigned to the Candy Hill Road, Plympton Road, and Water Row corridor and 28% were assigned to the Route 27 corridor. All weekday PM peak hour eastbound trips continued to be assigned to the Route 27 corridor.

Adding traffic volumes from the "Proposed Project" to the Candy Hill Road, Plympton Road, and Water Row corridor gives rise to safety concerns as the pavement on these roads is so narrow that passenger vehicles must slow, stop, or pull off the pavement in order to pass. These restrictions would be even more severe for trucks. These roads can only accommodate vehicles at low speed and peak period through commuter traffic would tend to travel at higher speeds.

6.4.1. “APPROVED TOWNHOUSE PROJECT” 2025 BUILD TRAFFIC VOLUMES

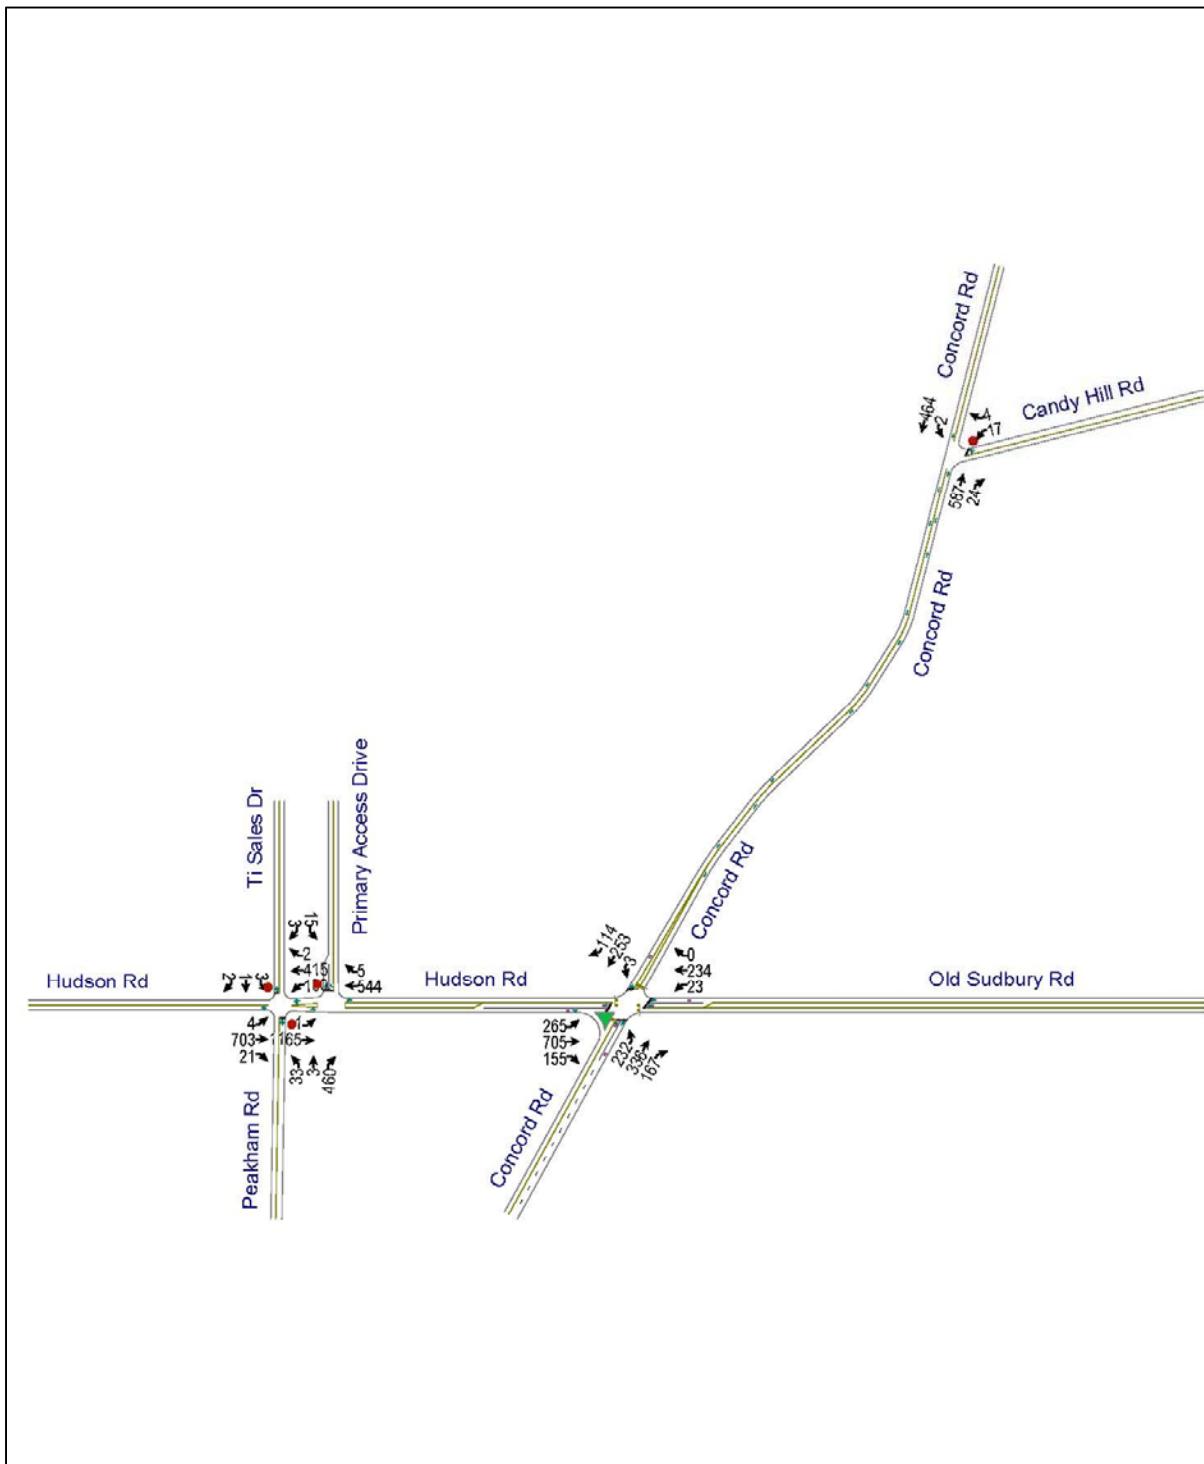

The “Approved Townhouse Project” provides 30 townhouses in 6 duplex buildings and 6 triplex buildings. As used in the current editions of the ITE Trip Generation Manual, multifamily housing includes townhouses located within the same building with at least three other dwelling units. Therefore trips generated by the units in duplex buildings are forecast using the Single-Family Detached Housing (ITE Land Use: 210) category. As used in the ITE Trip Generation Manual, low-rise multifamily housing includes townhouses located within the same building with at least three other dwelling units that have one or two levels (floors). Trips generated by the units in triplex buildings are forecast using the Multifamily Housing (Low-Rise) (ITE Land Use: 220) category.

As shown in Table 6.4-1, the “Approved Townhouse Project” is forecast to generate 280 vehicle trips per day (140 entering/140 exiting). The “Approved Townhouse Project” will generate 24 vehicle trips during the Weekday AM Peak Hour (6 entering/18 exiting) and will generate 28 vehicle trips during the Weekday PM Peak Hour (18 entering/10 exiting)

6.4.2. "SUBMITTED PROJECT" 2025 BUILD TRAFFIC VOLUMES

The "Submitted Project" provides 36 townhouses in 5 buildings and 214 flats in 5 mid-rise multifamily buildings. In accordance with the current edition of the ITE Trip Generation Manual, trips generated by the townhouses are forecast using the Multifamily Housing (Low-Rise) (ITE Land Use: 220) category and trips generated by the flats are forecast using the Multifamily Housing (Mid-Rise) (ITE Land Use: 221) category.

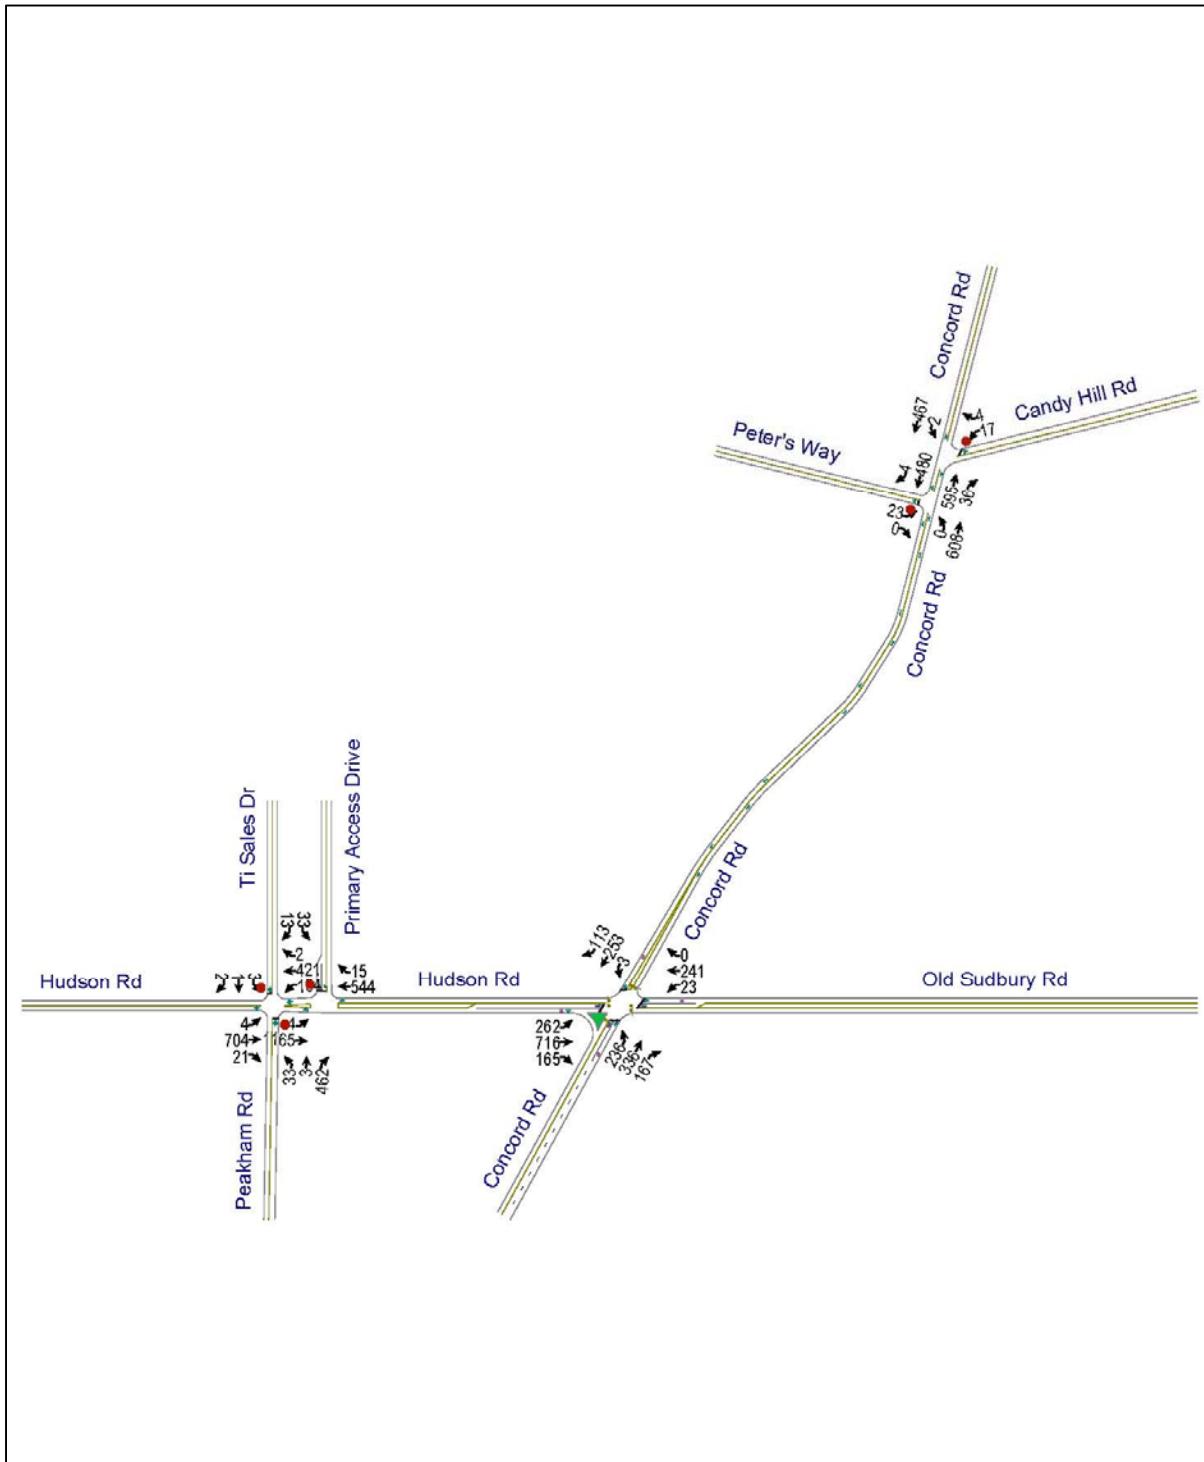

As shown in Table 6.4-2, the "Submitted Project" is forecast to generate 1429 vehicle trips per day (715 entering/714 exiting). The "Approved Townhouse Project" will generate 92 vehicle trips during the Weekday AM Peak Hour (23 entering/69 exiting) and will generate 117 vehicle trips during the Weekday PM Peak Hour (72 entering/45 exiting).

The trip generation forecast provided below is lower than the trip generation forecast provided in the "Submitted TIAS."

6.4.3. PLANNED AND FUNDED TRANSPORTATION IMPROVEMENTS

The Town completed reconstruction of the Hudson Road/Concord Road/Old Sudbury Road Intersection. No other transportation improvement projects are pending within the Transportation Study Area or directly affecting operations within the TSA.

6.5. 2025 OPERATIONS ANALYSIS

Intersection operations are described in terms of level-of-service which range from A to F. The level-of-service criteria for unsignalized intersections are different than those for a signalized intersection primarily because drivers expect different levels of performance at signalized and unsignalized intersections.

Level of service for signalized intersections is defined in terms of control delay for the total intersection. LOS criteria for traffic signals are stated in term of the average control delay per vehicle. Levels-of-service range from A to F and are defined to represent reasonable ranges in control delay which are shown in Table 5.6-1.

Level of service for an unsignalized two-way stop-controlled intersection is determined by the computed or measured control delay and is defined for each minor movement. LOS is not defined for the intersection as a whole. LOS criteria for unsignalized TWSC intersections are shown in Table 5.6-2.

As shown in Table 6.5-1 with the 2025 No-Build Traffic Volumes, the signalized Hudson Road/Concord Road/Old Sudbury Road Intersection operates with unacceptable delays for the overall intersection during the weekday AM peak hour ($v/c = 2.66$, LOS F, $D=\$791$ sec.).⁴ The intersection is also characterized by unacceptable delays for the overall intersection during the weekday PM peak hour ($v/c = 1.29$, LOS F, $D=136$ sec.).

As shown in Table 6.5-3 with the 2025 No-Build Traffic Volumes, the unsignalized Peckham Road/Hudson Road Intersection operates with unacceptable delays based on the minor approach (Peckham Road northbound) during the weekday AM peak hour ($v/c = 2.66$, LOS F, $D=\$791$ sec.). The intersection also operates with unacceptable delays based on the minor approach during the weekday PM peak hour ($v/c = 9.91$, LOS F, $D=4300$ sec.).

With the 2025 No-Build Traffic Volumes, the unsignalized Concord Road/Candy Hill Road Intersection operates at level-of-service D based on the minor approach (Candy Hill Road eastbound) during the weekday AM peak hour ($v/c = 0.191$, LOS D, $D=26$ sec.). The intersection also operates at level-of-service D based on the minor approach during the weekday PM peak hour ($v/c = 0.160$, LOS D, $D=23$ sec.).

⁴ v/c is the volume to capacity ratio, LOS is the level-of-service, D is the control delay

As shown in Table 6.5-1 with the “Approved Townhouse Project” 2025 Build Traffic Volumes, the signalized Hudson Road/Concord Road/Old Sudbury Road Intersection operates with unacceptable delays for the overall intersection during the weekday AM peak hour ($v/c = 1.31$, LOS F, D=113 sec.).⁵ The intersection is also characterized by unacceptable delays for the overall intersection during the weekday PM peak hour ($v/c = 1.34$, LOS F, D=151 sec.).

1. Volume to capacity ratio.
2. Control delay in seconds.
3. Level-of-service.

With the “Approved Townhouse Project” 2025 Build Traffic Volumes, the unsignalized Concord Road/Candy Hill Road Intersection operates at level-of-service D based on the minor approach (Candy Hill Road eastbound) during the weekday AM peak hour ($v/c = 0.192$, LOS D, D=27 sec.). The intersection operates at level-of-service C based on the minor approach during the weekday PM peak hour ($v/c = 0.161$, LOS C, D=23 sec.).

With the “Approved Townhouse Project” 2025 Build Traffic Volumes, the unsignalized Primary Site Drive/Hudson Road Intersection operates with unacceptable delays based on the minor approach (Primary Access Drive southbound) during the weekday AM peak hour ($v/c = 0.210$, LOS f, D=54 sec.). The intersection operates at level-of-service C based on the minor approach during the weekday PM peak hour ($v/c = 0.244$, LOS f, D=101 sec.).

As shown in Table 6.5-2 with the “Submitted Project” 2025 Build Traffic Volumes, the signalized Hudson Road/Concord Road/Old Sudbury Road Intersection operates with unacceptable delays for the overall intersection during the weekday AM peak hour ($v/c = 1.33$, LOS F, D=118 sec.).⁶ The intersection is also characterized by unacceptable delays for the overall intersection during the weekday PM peak hour ($v/c = 1.54$, LOS F, D=159 sec.).

As shown in Table 6.5-4 with the “Submitted Project” 2025 Build Traffic Volumes, the unsignalized Peckham Road/Hudson Road Intersection operates with unacceptable delays based on the minor approach (Peckham Road northbound) during the weekday AM peak hour ($v/c = 2.66$, LOS F, D=\$791 sec.). The intersection also operates with unacceptable delays based on the minor approach during the weekday PM peak hour ($v/c = 11.46$, LOS F, D=5034 sec.).

With the “Submitted Project” 2025 Build Traffic Volumes, the unsignalized Concord Road/Candy Hill Road Intersection operates at level-of-service D based on the minor approach (Candy Hill Road eastbound) during the weekday AM peak hour ($v/c = 0.192$, LOS D, D=27 sec.). The intersection operates at level-of-service C based on the minor approach during the weekday PM peak hour ($v/c = 0.262$, LOS C, D=28 sec.).

With the “Submitted Project” 2025 Build Traffic Volumes, the unsignalized Primary Site Drive/Hudson Road Intersection operates with unacceptable delays based on the minor approach (Primary Access Drive southbound) during the weekday AM peak hour ($v/c = 0.192$, LOS F, D=231 sec.). The intersection operates at level-of-service C based on the minor approach during the weekday PM peak hour ($v/c = 0.879$, LOS F, D=101 sec.).

With the “Submitted Project” 2025 Build Traffic Volumes, the unsignalized Peter’s Way and Concord Road Intersection operates at level-of-service C based on the minor approach (Peter’s Way eastbound) during the weekday AM peak hour ($v/c = 0.120$, LOS C, D=25 sec.). The

⁶ v/c is the volume to capacity ratio, LOS is the level-of-service, D is the control delay

intersection operates at level-of-service B based on the minor approach during the weekday PM peak hour ($v/c = 0.017$, LOS B, D=13 sec.).

The “Submitted Project” as used in this TIA and the “Proposed Project” as used in the “Submitted TIAS” are the same project. However, there are significant differences in intersection operations between the “Submitted TIAS” and the above analysis. With respect to the signalized Hudson Road/Concord Road/Old Sudbury Road Intersection with the 2025 Build AM peak hour traffic volumes, intersection operations as set forth above are unacceptable ($v/c = 1.33$, LOS F, D=118.2 sec.) whereas the “Submitted TIAS” found that intersection operations are acceptable ($v/c = 0.93$, LOS F, D=34 sec.). With the 2025 Build AM peak hour traffic volumes, the intersection operations remain unacceptable as set forth above ($v/c = 1.54$, LOS F, D=159.2 sec.) whereas the “Submitted TIAS” found that intersection operations are acceptable ($v/c > 1$, LOS D, D=54 sec.). Significant differences also exist at unsignalized intersection locations as set forth below vs the analysis provided in the “Submitted TIAS”. These differences can be attributed to the updated methodology described in Section 2.3

6.6. 2025 QUEUE LENGTH ANALYSIS

6.6.1. HUDSON ROAD/CONCORD ROAD/OLD SUDBURY ROAD INTERSECTION

Queuing is analyzed with the morning and evening (AM/PM) peak hour volumes for the 2018 Existing conditions (2018 EX), the 2025 No-Build conditions (2025 No-Build), and for the 2025 “Approved Townhouse Project” and the 2025 “Submitted Project” conditions (both 2025 Build) volumes abbreviated as (AM/PM) (2018 EX/2025 No-BLD/BOTH 2025 BLD).

The eastbound approach to the Hudson Road/Concord Road/Old Sudbury Road Intersection has a left-turn lane, 1 through lane, and a channelized free-right lane. The left-turn lane has 325 ft. of available storage. The available storage for the through lane is limited by the separation to the Peckham Road/Hudson Road Intersection to the west. Queues longer than 750 feet will block the Peckham Road/Hudson Road Intersection.

The 325 ft. of available storage for the eastbound left-turn lane is not sufficient for the 95th percentile queues for the PM peak hour 2025 No-Build and both 2025 Build volumes. The eastbound left-turn volume on Hudson Road exceeds capacity during the PM peak hour for the 50th percentile volumes for both Build conditions and for the 95th percentile volumes for all analyzed PM volumes and queue length cannot accurately be modeled using the Highway Capacity Manual methods and actual queues may be longer.

The 750 ft. of available storage for the eastbound through lane is not sufficient for the 50th percentile queues for the AM peak hour 2025 No-Build and both 2025 Build volumes. Available storage is not sufficient for the 95th percentile queues for the AM and PM peak hours for all

analyzed volumes. When queues exceed 750 ft. the Peckham Road/Hudson Road Intersection is blocked.

The 130 ft. of available storage for the westbound left lane is sufficient for the 50th percentile queues and the 95th percentile queues for all analyzed traffic volumes. The 1,500+ ft. of available storage for the westbound through/right lane is sufficient for the 50th percentile queues and the 95th percentile queues for all analyzed traffic volumes. The longest queues of over 1000 feet form with the PM 2025 build volumes. The westbound through volume on Hudson Road exceeds capacity during the PM peak hour for the 50th percentile volumes and the 95th percentile volumes for the 2025 No-Build condition and for both Build conditions and queue length cannot accurately be modeled using the Highway Capacity Manual methods and actual queues may be longer.

The 375 ft. of available storage for the northbound left lane is not sufficient for the 50th percentile queues for the PM peak hour 2025 No-Build and both 2025 Build volumes. Available storage is not sufficient for the 95th percentile queues for the AM and PM peak hours for all analyzed volumes. The northbound left volume on Concord Road exceeds capacity during the AM and PM peak hours for the 50th percentile volumes and the 95th percentile volumes for all analyzed volumes and queue length cannot accurately be modeled using the Highway Capacity Manual methods and actual queues may be longer.

The 1,500+ ft. of available storage for the northbound through/right lane is sufficient for the 50th percentile queues and the 95th percentile queues for all analyzed traffic volumes. The northbound through/right volume on Concord Road exceeds capacity during the AM peak hour for the 95th percentile volumes for all analyzed conditions and queue length cannot accurately be modeled using the Highway Capacity Manual methods and actual queues may be longer.

For the southbound approach to the Hudson Road/Concord Road/Old Sudbury Road Intersection, 1350 feet of storage is available. The available storage length is determined by the queue length causing blockage of the proposed Peter's Way and Concord Road Intersection. For the southbound approach to the Hudson Road/Concord Road/Old Sudbury Road Intersection, the approach volume exceeds capacity for the 50th percentile volumes for the PM peak hour for all conditions and the AM peak hour for both Build conditions and for the 95th percentile volumes for all conditions analyzed and queue length cannot accurately be modeled using the Highway Capacity Manual methods and actual queues may be longer. Due to the limitations of the methodology, we turn to field observation to accurately quantify queue length. The calculated lengths are significantly shorter than the observed queue lengths. These longer queue lengths are consistent with the experience of Sudbury officials where the delay at the Hudson Road/Concord Road/Old Sudbury Road Intersection, regularly results in queues blocking the Peter's Way.

Eastbound left (EBL), eastbound through (EBT), westbound left (WBL), westbound through/right (WBT/R), northbound left (NBL), northbound through/right (NBT/R), southbound left through right (SBLTR).

⊗ Deficient storage.

~ Volume exceeds capacity, queue is theoretically infinite.

95th percentile volume exceeds capacity, queue may be longer.

Our consultant, Accurate Counts, monitored vehicle queues at Peter's Way during peak hours on May 24, 2018. The southbound queues were observed to block access to Peter's Way from 4:00 PM to 4:35 PM, from 4:37 PM to 5:10 PM, and from 5:13 PM to 6:00 PM. Except for approximately 5 minutes out of the entire two-hour evening peak traffic period, the southbound queues on Concord Road blocked access to Peter's Way, Peter's Way was unblocked by only 5 minutes.

6.6.2. PECKHAM ROAD/HUDSON ROAD INTERSECTION

There is 1,500+ ft. of available storage for the northbound approach. The approach is characterized by severe delays and queues are very long. For the AM peak hour, 95th percentile queues range from 39.4 vehicles for the 2018 Existing condition to 53.6 vehicles for the "Submitted Project" 2025 Build condition. For the PM peak hour, 95th percentile queues range from 24.4 vehicles for the 2018 Existing condition to 33.1 vehicles for the "Submitted Project" 2025 Build condition.

6.6.3. OTHER INTERSECTIONS

Queues at the Concord Road/Candy Hill Road Intersection are 1 vehicle or less for all analyzed traffic volumes.

Southbound queues at the Primary Site Drive/Hudson Road Intersection are less than one vehicle with the AM and PM peak hour "Approved Townhouse Project" 2025 Build volumes. Southbound queues at the Primary Site Drive/Hudson Road Intersection are 2.2 vehicles with the AM peak hour "Submitted Project" 2025 Build volumes and 3.6 vehicles with the PM peak hour "Submitted Project" 2025 Build volumes.

Westbound queues at the Peter's Way and Concord Road Intersection are less than 0.5 vehicle with the AM and PM peak hour "Submitted Project" 2025 Build volumes.

6.7. ACCESS MANAGEMENT AND CIRCULATION ANALYSIS

6.7.1. "APPROVED TOWNHOUSE PROJECT" ACCESS AND CIRCULATION

The "Approved Townhouse Project" is served by a 665 foot long Primary Access Drive that intersects with Hudson Road between Peakham Road and the Gilmartin residence. To ensure safe and convenient access, this access drive complies with the requirements for a street as set forth in the "Planning Board Town of Sudbury, Massachusetts Rules and Regulations Governing the Subdivision of Land, 9/10/1973 last revised 6/18/2014" (Rules & Regulations). The Primary Access Drive has a 24 foot wide pavement terminating in a 100 foot diameter cul-de-sac capable of turning an AASHTO Bus 40 template that is used to model turns by fire apparatus.

The cul-de-sac also provides ample room to accommodate turns by service and delivery vehicles.

The relatively small volume of trips generated by the “Approved Townhouse Project”, allows the Primary Access Drive to have a single approach lane to Hudson Road. With a narrower break in the sidewalk, the “Approved Townhouse Project” provides better pedestrian safety in an area with numerous vehicle conflicts caused by the close spacing of the Concord Road/Candy Hill Road Intersection and the Primary Site Drive/Hudson Road Intersection as well as large commercial driveways. Vehicle, pedestrian, and bicycle conflicts will increase upon completion of the Bruce Freeman Rail Trail which crosses through the intersection.

As each townhouse unit has two dedicated parking spaces, there is no need to circulate on-site searching for an available parking space. The townhouses are all located within 500 feet of each other and there should be no need for automobile use for interactions between project residents.

Each unit is provided with two parking spaces which should typically be sufficient for residents. Occasional visitor and service parking can be accommodated along the Primary Access Drive. Parking would be limited to one side of the Primary Access Drive to ensure unimpeded emergency vehicle access and to provide room for snow storage along the edge of pavement.

6.7.2. “SUBMITTED PROJECT” ACCESS AND CIRCULATION

The “Submitted Project” has two entrances, one is located on Hudson Road, just east of the Peakham Road intersection. The other entrance is located on Concord where the existing unpaved Peters Way will be constructed and extended to serve as an entrance to the Project Site.

As a principal entrance to a significant residential project, Peter’s Way should be constructed in conformance with the requirements of the “Planning Board Town of Sudbury, Massachusetts Rules and Regulations Governing the Subdivision of Land, 9/10/1973 last revised 6/18/2014” (Rules & Regulations).

With respect to horizontal alignment, the Rules & Regulations require a minimum radius of 150 feet whereas Peters Way Extension provides a horizontal curve with a radius of approximately 70 feet. This would be a hazard for general traffic and particularly for emergency vehicles traveling at increased speed.

Safety concerns regarding this segment of Concord Road led the Zoning Board of Appeals to preclude use of Peter’s Way as a project entrance. In fact, a vehicle crash resulting in a fatality was reported at the Concord Road/Candy Hill Road Intersection in 2016.

Maintaining a minimum safe separation distance between the centerlines of vehicular facilities is a key to satisfy operational and safety concern. A basic tenet of safe roadway design is simplifying the driving function by isolating driver decisions. An intersection represents a location where multiple driver decisions are required. Accordingly a driver should completely clear an intersection before encountering another intersection requiring multiple driver decisions. This can be achieved by maintaining spacing between intersection of no less than the stopping sight distance for a particular segment of roadway based upon the greater of the posted speed or the 85th percentile speed of roadway traffic. For Concord Road at the proposed site driveway, the 85th percentile speed of roadway traffic governs.

Vehicle speed was measured by Automatic Traffic Recorder on May 24, 2018 on Concord Road. The 85th percentile speed of northbound traffic on Concord Road south of Peter's Way Extension is 37 miles per hour (mph) which is higher than the 85th percentile speed of southbound traffic (35 mph). The required stopping sight distance (SSD) for 37 miles per hour is 267 feet. Therefore the centerline of Peters Way Extension should be separated from the centerline of Candy Hill Road by a minimum of 267 feet. The centerline of Peters Way Extension is separated from the centerline of Candy Hill Road by approximately 120 ft. Therefore drivers cannot process conflicts at the Candy Hill Road intersection and conflicts at the Peters Way Extension intersection separately. The resulting complexity of driver decision making raises safety concerns.

Vehicle queues at the Hudson Road/Concord Road/Old Sudbury Road Intersection regularly extend north on Concord Road through the Peter's Way and Candy Hill Road intersections. On May 24, 2018 when updated traffic counts were taken, our consultant, Accurate Counts, monitored vehicle queues at the location of the Peter's Way and Concord Road Intersection during peak hours. During the PM Peak Hour, southbound vehicle queues blocked access to Peter's Way during the majority of the evening peak traffic period from 4:00 PM to 4:35 PM, from 4:37 PM to 5:10 PM, and from 5:13 PM to 6:00 PM. During the entire two-hour evening peak traffic period, Peter's Way was blocked by queued vehicles for all but approximately 5 minutes. Not only is access to the Project Site impaired, but northbound vehicles unable to turn left into Peter's Way will block northbound through traffic on Concord Road.

The vehicle queues that extend across the Peter's Way and Concord Road Intersection not only block access and cause delay to project generated traffic and through traffic, they also obstruct sight distance giving rise to safety concerns. In particular, vehicles exiting the site turning left have sight distance to the right restricted by the queued vehicles to the right. The extent of the sight distance restriction varies with vehicle headway, the height of eye of driver of the exiting vehicle, and the size and height of the nearest vehicles in queue. Vehicles exiting the site and turning left should have intersection sight distance (ISD) of 408 feet (Case B1 left turn from stop on minor road). With impaired sight distance, a vehicle proceeding into the northbound travel lane risks a vehicle crash.

The vehicle queues that extend across the Peter's Way and Concord Road Intersection also obstruct sight distance for northbound through traffic on Concord Road. The northbound driver's view of vehicles exiting the site and turning left will be restricted and the northbound vehicle may not be able to stop in time. The extent of the sight distance restriction varies with the separation, size, and height of the vehicles in queue nearest to the vehicle exiting from Peter's Way. Northbound through (passenger) vehicles must have stopping sight distance (SSD) of 267 feet. With impaired sight distance, the northbound may be unable to stop in time to avoid a crash.

Locating a principal project entrance diagonally opposite Candy Hill Road results in trips generated by the "Submitted Project" using the Candy Hill Road, Plympton Road, and Water Row alternative route ("Alternative Route") to access points on Route 27 east of Water Row. Trips having origins and destinations accessed by Route 27 to the east represent a significant portion of the overall trips generated by the "Submitted Project." Project generated trips would only be assigned to this "Alternative Route" with the "Submitted Project". The "Approved Townhouse Project" does not have an entrance near Candy Hill Road and the "Alternative Route" does not minimize travel time for vehicles using the Primary Site Drive/Hudson Road Intersection.

Based on timed comparative travel runs during the morning and evening peak hours, travel time is minimized by using the "Alternative Route" to access Route 27 east for eastbound vehicles leaving the "Project Site" during morning peak travel times and for westbound vehicles entering the project Site during evening peak travel times. The roads along the "Alternative Route" are low speed rural country roads unsuited to accommodate though traffic. Candy Hill Road and Plympton Road in particular have segments where pavement widths are so narrow that it is necessary for opposing vehicles to slow, stop, and even pull off the pavement in order to pass. Impacting these rural roadways with significant volumes of traffic generated by the "Proposed Project" raises measurable safety concerns.

The Primary Site Drive/Hudson Road Intersection is also not suited to serve the trips generated by a 250 unit project. The Primary Site Drive/Hudson Road Intersection is also blocked by queues from the Hudson Road/Concord Road/Old Sudbury Road Intersection. Vehicles exiting the Project Site that turn left are blocked by queued vehicles. This in turn gives rise to the same sight distance restrictions caused by queued vehicles at Peter's Way and Concord Road Intersection. Similarly an eastbound vehicle turning left onto the Primary Access Drive will be unable to complete ties turn and eastbound through traffic on Hudson Road will be blocked.

If the Peter's Way and Concord Road Intersection is eliminated and the size of the project is not reduced, 250 residential units would be located on what is the equivalent of a "dead end street" some 1,650 feet in length. The Planning Board Rules & Regulations limit the length of

Dead End Street to 1,200 ft. serving and serving as the sole means of access for a much smaller number of dwellings.

The risk of a vehicle crash at the Primary Site Drive/Hudson Road Intersection which would potentially block or limit access to the Project Site is enhanced by the complexity of vehicle, bicycle, and pedestrian movements within the intersection and the numerous points of conflict which these movements create. All movements by all modes within the intersection are measurably limited by sight distance constraints imposed by vehicles queued within the intersection. The centerline of the Site Drive and the centerline of Peakham Road are offset by approximately 120 feet creating conflicts with turning vehicles. Additional bicycle trips will be introduced in the intersection with construction of the Bruce Freeman Rail Trail. Additionally the Ti Sales industrial driveway comprising one leg of the intersection that adds additional conflicting movements that include heavy trucks.

The probability of on-site vehicle crashes and resulting potential access drive blockages is enhanced by perpendicular parking on both sides of the site access drives contributes to potential on-site vehicle crashes.. This is particularly critical for the first 700 feet of the Primary Access Drive where it constitutes the sole means of accessing Hudson Road.

6.7.3. SIGHT DISTANCE AT PROJECT ACCESS DRIVES

Required stopping sight distance and intersection sight distance are calculated using the procedures of the American Association of State Highway and Transportation Officials (AASHTO) and are calculated based upon the 85th percentile travel speed and gap determined by vehicle type. Available stopping sight distance is field measured using a 3.5 foot high height of eye and a 2.0 foot high object. The height of object models the height of a vehicle bumper. Available intersection sight distance is field measured using a 3.5 foot high height of eye and a reciprocal 3.5 foot high object.

The eastbound 85th percentile speed on Hudson Road was measured as 31 miles per hour (mph) on May 24, 2008. Required stopping sight distance is calculated to be 206 feet. Available stopping sight distance (SSD) was measured to be 575 ft. and is sufficient.

The westbound 85th percentile speed on Hudson Road was measured as 32 miles per hour (mph). Required stopping sight distance is calculated to be 216 feet. Available stopping sight distance (SSD) was measured to be 225 ft. and is marginally sufficient.

Intersection sight distance for Case B1 left turn from stop on minor road is calculated as 342 ft. Available intersection sight distance was field measured as 550 ft. and is sufficient. Intersection sight distance for Case B2 right turn from stop on minor road is calculated as 306 ft. Available intersection sight distance was field measured as 225 ft. and is deficient. Deficient intersection

sight distance will cause vehicles on the through road to stop or slow to accommodate maneuvers by minor road vehicles and thus degrade operations for through traffic.

As described in Section 6.7.2, sight distance is regularly restricted during peak traffic periods at the Peter's Way and Concord Road Intersection due to the southbound queue of vehicles extending from the Hudson Road/Concord Road/Old Sudbury Road Intersection. Outside of peak periods when queues are shorter, required sight distance is determined by the travel speed of vehicles approaching on Concord Road.

The northbound 85th percentile speed on Concord Road was measured as 37 miles per hour (mph) on May 24, 2008. Required stopping sight distance is calculated to be 267 feet. Available stopping sight distance (SSD) was measured to be 480 ft. and is sufficient.

The southbound 85th percentile speed on Concord Road was measured as 35 miles per hour (mph). Required stopping sight distance is calculated to be 246 feet. Available stopping sight distance (SSD) was measured to be 600 ft. and is sufficient.

Intersection sight distance for Case B1 left turn from stop on minor road is calculated as 408 ft. Available intersection sight distance was field measured as 420 ft. and is marginally sufficient. Intersection sight distance for Case B2 right turn from stop on minor road is calculated as 334 ft. Available intersection sight distance was field measured as 600 ft. and is sufficient.

6.7.4. CUT-THROUGH TRAFFIC

Cut-through traffic concerns were raised during the Comprehensive Permit review process by the Board's peer review consultant Vanasse and Associates and were reviewed by Town public safety officials. A gate was considered to prevent cut through traffic. Turn restrictions were also considered but we understand were not acceptable to Town public safety officials. We are unaware as to whether traffic calming measures were evaluated. In any instance, there was no resolution of this issue nor can there be a resolution absent decisions from Town public safety officials. The Zoning Board of Appeals decision to eliminate the Peter's Way and Concord Road Intersection resolves the issue for the "Approved Townhouse Project". For the "Submitted Project", the issue remains unresolved.

It is unacceptable to have cut through traffic using the private driveway system for the "Submitted Project" given its design and geometric limitations. There is a sharp horizontal curve on Peter's Way Extension that would pose a hazard to through traffic. In addition, there is no system of dedicated access drives on the "Project Site." On-site vehicle access is provided by a connected series of parking areas where the parking lot aisles serve as defacto access drives. This system is not suitable to accommodate through traffic. In particular, all parking spaces within these parking areas are perpendicular to the parking lot aisle and every vehicle backing in or out of each parking space presents a point of conflict.

The route cutting through the site would attract substantial traffic during peak periods. The distance along the on-site system of drives and linked parking lot aisles is approximately 2,630 linear feet from the Peter's Way on Concord Road to the site entrance on Hudson Road. At an average speed of 20 miles per hour exclusive of delay at the site exit, cutting through the site takes approximately 1 minute 30 seconds. In comparison the travel time between these two site entrances along Concord Road southbound and Hudson Road westbound with the "Submitted Project" 2025 Build traffic volumes is approximately 2 minutes 45 seconds in the morning peak hour and 2 minutes 40 seconds in the evening peak hour. The reverse trip from the site entrance on Hudson Road to Peter's Way on Concord road would take approximately 1 minute 30 seconds cutting though the site vs approximately 2 minutes 30 seconds in the morning peak hour and 2 minutes 55 seconds in the evening peak hour along Hudson Road eastbound and Concord Road northbound.

6.8. PARKING

6.8.1. "APPROVED TOWNHOUSE PROJECT" PARKING

Each of the 30 townhouses will have a garage parking place and a driveway parking space totaling 60 parking spaces or 2 parking places per dwelling unit. The parking supply provided complies with the 2 parking spaces per dwelling unit required by the Zoning Bylaw.⁷

For the townhouses in duplex buildings, Institute of Transportation Engineers (ITE's) Single-Family Detached Housing Land Use Category (210) applies. ITE states that the average parking supply ratio is 2.0 parking spaces per dwelling unit for suburban (within urban growth boundary) Single-Family Detached Housing (210).⁸ ITE states the observed average peak period parking demand is 1.83 parked vehicles per dwelling unit. The parking supply provided for the "Approved Townhouse Project" is sufficient to accommodate this demand.

For the townhouses in triplex buildings, Institute of Transportation Engineers (ITE's) Low/Mid-Rise Apartment Land Use Category (221) applies. ITE states that the observed average peak period parking demand is 1.23 parked vehicles per dwelling unit.⁹ The parking supply provided for the "Approved Townhouse Project" is sufficient to accommodate this demand.

In addition to the 2 parking spaces provided for each townhouse, visitor parking is available along the Primary Access Drive. To ensure emergency vehicle access and to provide room for snow storage in windrows along the edge of pavement, parking will be restricted to one side of the Primary Access Drive. With parking restricted to one side, the Primary Access Drive provides approximately 30 visitor parking spaces.

⁷ Zoning Bylaw Article IX 2003, Table of Parking Requirements, p 16.

⁸ Institute of Transportation Engineers, Parking Generation (ITE), 4th Edition, Land Use Category 210.

⁹ Institute of Transportation Engineers, Parking Generation (ITE), 4th Edition, Land Use Category 221.

6.8.2. "SUBMITTED PROJECT" PARKING

The “Submitted Project” provides 256 garage parking spaces (including 10 accessible parking spaces) and 238 surface parking spaces (including 14 accessible parking spaces) for a total of 494 parking spaces or 1.98 parking spaces per dwelling unit. The parking supply provided falls just short of the 2 parking spaces per dwelling unit required by the Zoning Bylaw.¹⁰

For the townhouses in 7 and 8 unit buildings and all other proposed dwelling units, the Institute of Transportation Engineers (ITE’s) Low/Mid-Rise Apartment Land Use Category (221) applies. ITE states that the observed average peak period parking demand is 1.23 parked vehicles per dwelling unit.¹¹ The parking supply provided for the “Approved Townhouse Project” is sufficient to accommodate this demand.

The overall parking layout gives rise to safety concerns because there is no hierarchy separating through access drives from parking bays. Although the overall access drives extend some 1,500 feet from Hudson Road to the furthest dwelling unit and conversely the drives extend some 2,300 feet from Concord Road to the furthest dwelling unit, there are perpendicular parking spaces along some 1,100 feet of these access drives. Each of the over 200 perpendicular parking spaces creates a point of conflict as vehicles back in or back out of the perpendicular parking spaces into the path of higher speed through vehicles.

No information is provided concerning a parking management plan and parking pricing. There are no provisions for bicycle parking or for charging for electric vehicles.

6.9. MITIGATING MEASURES

6.9.1. "APPROVED TOWNHOUSE PROJECT" MITIGATION

Eliminating the need to construct the Peter’s Way and Concord Road Intersection and elimination of this intersection is in itself a key measure to minimize and mitigate traffic impacts for this alternative. The key concern of sight distance deficiencies caused by queued vehicles on Concord Road with vehicles using the Peter’s Way and Concord Road Intersection is resolved. The complex driver decision process caused by close spacing of the Peter’s Way and Candy Hill Road Intersections is eliminated with elimination of this site entrance. Assigning measurable new vehicle trips to Candy Hill Road, Plympton Road, and Water Row with their substandard pavement widths will not occur with the “Approved Townhouse Project” as the “Alternative Route” is not a viable alternative for vehicle trips using the Peckham Road/Hudson Road Intersection.

¹⁰ Zoning Bylaw Article IX 2003, Table of Parking Requirements, p 16.

¹¹ Institute of Transportation Engineers, Parking Generation (ITE), 4th Edition, Land Use Category 221.

The primary reason for the Zoning Board of Appeals limiting the number of dwelling units to 30 was to limit the length of the on-site dead end access drive. However, the reduction in dwelling units for the “Approved Townhouse Project” in comparison to the “Submitted Project” is highly effective minimizing and mitigating traffic impacts at all intersection locations in the Transportation Study Area.

6.9.2. “SUBMITTED PROJECT” MITIGATION

Traffic Impact mitigation for the “Submitted Project” is limited to installation of a flashing warning beacon at the Peckham Road/Hudson Road Intersection.

No measures are proposed to avoid or minimize or to mitigate impacts caused by use of the Peter’s Way and Concord Road Intersection in terms of sight distance restrictions caused by queued traffic and the resulting safety concerns caused by sight distance restriction

No measures are proposed to avoid or minimize or to mitigate impacts caused by use of the Peter’s Way and Concord Road Intersection in terms of queued vehicles blocking northbound left turns into the site and the resulting blockage of through traffic northbound.

No measures are proposed to avoid or minimize or to mitigate impacts caused by use of the Peter’s Way and Concord Road Intersection in terms of increasing the complexity of driver decisions relating to the closely spaced intersections of Peter’s Way and Candy Hill Road approximately 120 feet apart.

No measures are proposed to avoid or minimize or to mitigate impacts caused by use of the Peter’s Way and Concord Road Intersection in terms of attracting numerous new vehicle trips to the Candy Hill Road, Plympton Road, and Water Row alternative route with its inherent pavement section deficiencies and resulting impaired vehicle operations.

No measures are proposed to avoid or minimize or to mitigate impacts caused by use of the Primary Site Drive/Hudson Road Intersection in terms of sight distance restrictions caused by queued traffic and the resulting safety concerns caused by sight distance restriction.

No measures are proposed to avoid or minimize or to mitigate impacts caused by use of the Primary Site Drive/Hudson Road Intersection in terms of queued vehicles blocking eastbound left turns into the site and the resulting blockage of through traffic eastbound.

No measures are proposed to avoid or minimize or to mitigate impacts caused by use of the Primary Site Drive/Hudson Road Intersection in terms of increasing the complexity of driver decisions relating to the closely spaced intersections of the Primary Site Drive and Peckham Road approximately 120 feet apart.

No measures are proposed to avoid or minimize or to mitigate construction phase traffic impacts by an effective Transportation Demand Management Plan to reduce short term construction trips.

No measures are proposed to avoid or minimize or to mitigate permanent traffic impacts by an effective Transportation Demand Management Plan to reduce trips by residents following completion and occupancy of the "Proposed Project."

6.10. CONCLUSION

6.10.1. CONCLUSION FOR THE "APPROVED TOWNHOUSE PROJECT"

Eliminating the Peter's Way and Concord Road Intersection is highly effective in avoiding and minimizing traffic impacts related to sight distance impairment for exiting vehicles, blocking through traffic on Concord Road at Peter's Way, requiring complex driver decisions due to close intersection spacing, and adding significant volumes of project generated trips to Candy Hill Road, Plympton Road, and Water Row.

The reduced trip generation arising from a reduction in the number of dwelling units in comparison to the number of dwelling units proposed with the "Submitted Project" is effective in minimizing traffic impacts at all intersection locations in the Transportation Study Area.

6.10.2. CONCLUSION FOR THE "SUBMITTED PROJECT"

Use of Peter's Way and Concord Road Intersection as a principal site entrance results in safety concerns as vehicles exit the site and turn left when the minimum required sight distance is compromised by queued vehicles. Queuing of vehicles is expected to persist throughout much of the evening peak hours. During the PM Peak Hour, queued southbound vehicles are expected to block northbound vehicles seeking to turn left into the Project Site, resulting in blocking of northbound traffic. The magnitude of all the above impacts is increased by the number of trips generated by 250 dwelling units.

The Peter's Way and Concord Road Intersection is located only $120\pm$ ft. from the Concord Road/Candy Hill Road Intersection which increases the complexity of driver decisions as drivers must process potential conflicts at two intersections simultaneously. The magnitude of this impact is increased by the number of trips generated by 250 dwelling units.

With a principal site entrance located diagonally opposite Candy Hill Road, measurable numbers of project generated trips with origins or destinations accessed by Route 27 to the east must be assigned to Candy Hill Road, Plympton Road, and Water Row. Due to narrow pavement and lower design speed, these roads are ill suited to accommodate an influx of new trips.

Transportation Impact Assessment
Development Alternatives for Sudbury Station
Comprehensive Permit (40B) Project
Sudbury, Massachusetts

The Primary Site Drive/Hudson Road Intersection also experiences sight distance restrictions caused by queued traffic. Queued westbound vehicles will also block eastbound left turns into the Project Site and potentially will also block eastbound through traffic. The magnitude of this impact is increased by the number of trips generated by 250 dwelling units.

The Primary Site Drive/Hudson Road Intersection is located only 120± ft. from the Peckham Road/Hudson Road Intersection which increases the complexity of driver decisions as drivers must process potential conflicts at two intersections simultaneously. The magnitude of this impact is increased by the number of trips generated by 250 dwelling units.

No construction phase Transportation Demand Management Plan to reduce short term impacts has been developed. No post construction Transportation Demand Management Plan to reduce impacts of the completed project has been developed.

TRIP GENERATION: APPENDIX 5

Trip Generation for Single-Family Detached Housing (210) [1]

Vehicle Trip Ends vs Dwelling Units on a Weekday

24 Hour Total

Setting/Location: General Urban/Suburban

Number of Studies: 159

Average Number of Dwelling Units: 264

Directional Disttribution: 50% Entering; 50% Exiting

Average Vehicle Trip Ends vs Dwelling Units on a Weekday

where x = 12 Dwelling Units

Using Using In(X) Equation

$$\begin{aligned} T &= 0.92 \ln(X) + 2.71 && 50\% \text{ Enter; } 50\% \text{ Exit} \\ &= 148 \text{ Trips} && 74 \text{ Enter; } 74 \text{ Exit} \end{aligned}$$

Trip Generation for Single-Family Detached Housing (210) [1]

Vehicle Trip Ends vs Dwelling Units on a Weekday

Peak Hour of Adjacent Street Traffic: One Hour Between 7 and 9 a.m.

Setting/Location: General Urban/Suburban

Number of Studies: 173

Average Number of Dwelling Units: 219

Directional Disttribution: 50% Entering; 50% Exiting

Average Vehicle Trip Ends vs Dwelling Units on a Weekday

where x = 12 Dwelling Units

Using Using Linear Equation

$$\begin{aligned} T &= 0.71 X + 4.8 && 25\% \text{ Enter; } 75\% \text{ Exit} \\ &= 14 \text{ Trips} && 4 \text{ Enter; } 10 \text{ Exit} \end{aligned}$$

Trip Generation for Single-Family Detached Housing (210) [1]

Average Vehicle Trip Ends vs Dwelling Units on a Weekday

Peak Hour of Adjacent Street Traffic: One Hour Between 4 and 6 p.m.

Setting/Location: General Urban/Suburban

Number of Studies: 190

Average Number of Dwelling Units: 242

Directional Disttribution: 50% Entering; 50% Exiting

Average Vehicle Trip Ends vs Dwelling Units on a Weekday

where x = 12 Dwelling Units

Using Using In(X) Equation

$$\begin{aligned} T &= 0.96 \ln(X) + 0.2 && 63\% \text{ Enter; } 37\% \text{ Exit} \\ &= 14 \text{ Trips} && 9 \text{ Enter; } 5 \text{ Exit} \end{aligned}$$

September 2017 © 2017

Trip Generation for Multifamily Housing (Low Rise) (220) [1]

Vehicle Trip Ends vs Dwelling Units on a Weekday

24 Hour Total

Setting/Location: General Urban/Suburban

Number of Studies: 29

Average Number of Dwelling Units: 168

Directional Disttibution: 50% Entering; 50% Exiting

Average Vehicle Trip Ends vs Dwelling Units on a Weekday

where $x = 18$ Dwelling Units

Using Using Average Rate

$$\begin{aligned} T &= 7.32 X && 50\% \text{ Enter; } 50\% \text{ Exit} \\ &= 132 \text{ Trips} && 66 \text{ Enter; } 66 \text{ Exit} \end{aligned}$$

Trip Generation for Multifamily Housing (Low Rise) (220) [1]

Vehicle Trip Ends vs Dwelling Units on a Weekday

Peak Hour of Adjacent Street Traffic: One Hour Between 7 and 9 a.m.

Setting/Location: General Urban/Suburban

Number of Studies: 42

Average Number of Dwelling Units: 199

Directional Disttibution: 50% Entering; 50% Exiting

Average Vehicle Trip Ends vs Dwelling Units on a Weekday

where $x = 18$ Dwelling Units

Using Using In(X) Equation

$$\begin{aligned} T &= 0.95 \ln(X) - 0.51 && 23\% \text{ Enter; } 77\% \text{ Exit} \\ &= 10 \text{ Trips} && 2 \text{ Enter; } 8 \text{ Exit} \end{aligned}$$

Trip Generation for Multifamily Housing (Low Rise) (220) [1]

Average Vehicle Trip Ends vs Dwelling Units on a Weekday

Peak Hour of Adjacent Street Traffic: One Hour Between 4 and 6 p.m.

Setting/Location: General Urban/Suburban

Number of Studies: 50

Average Number of Dwelling Units: 187

Directional Disttibution: 50% Entering; 50% Exiting

Average Vehicle Trip Ends vs Dwelling Units on a Weekday

where $x = 18$ Dwelling Units

Using Using In(X) Equation

$$\begin{aligned} T &= 0.89 \ln(X) + 0.02 && 63\% \text{ Enter; } 37\% \text{ Exit} \\ &= 14 \text{ Trips} && 9 \text{ Enter; } 5 \text{ Exit} \end{aligned}$$

SIGHT DISTANCE: APPENDIX 8

Primary Access Drive/Hudson Road Intersection

Westbound 85th Percentile Speed 32 Miles per Hour Measured on 5/24/2018

Stopping Sight Distance for Level Ground

$$d = 1.47Vt + 1.075 V^2 / a$$

where

t = break reaction time, 2.5 seconds

V = speed MPH

a = deceleration rate = 11.2 ft per second

$$V = 32 \quad SSD = 215.9$$

Intersection Sight Distance

Case B1 - Left Turn from Stop on the Minor Road

$$d = 1.47V t_g$$

where

V = speed MPH

t_g = time gap for minor road vehicle to enter the major road

$$V = 32 \quad ISD = 352.8$$
$$t_g = 7.5$$

x $t_g = 7.5$ seconds for passenger car

$t_g = 9.5$ seconds for truck

$t_g = 11.5$ seconds for combination truck

Case B2 - Right Turn from Stop on the Minor Road

$$d = 1.47V t_g$$

where

V = speed MPH

t_g = time gap for minor road vehicle to enter the major road

$$V = 32 \quad ISD = 305.8$$
$$t_g = 6.5$$

x $t_g = 6.5$ seconds for passenger car

$t_g = 8.5$ seconds for truck

$t_g = 10.5$ seconds for combination truck

Concord Road/Peter's Way Intersection

Northbound 85th Percentile Speed 37 Miles per Hour Measured on 5/24/2018

Stopping Sight Distance for Level Ground

$$d = 1.47Vt + 1.075 V^2 / a$$

where

t = break reaction time, 2.5 seconds

V = speed MPH

a = deceleration rate = 11.2 ft per second

$$V = 37 \quad SSD = 267.4$$

Intersection Sight Distance

Case B1 - Left Turn from Stop on the Minor Road

$$d = 1.47V t_g$$

where

V = speed MPH

t_g = time gap for minor road vehicle to enter the major road

$$V = 37 \quad ISD = 407.9$$
$$t_g = 7.5$$

x $t_g = 7.5$ seconds for passenger car

$t_g = 9.5$ seconds for truck

$t_g = 11.5$ seconds for combination truck

Case B2 - Right Turn from Stop on the Minor Road

$$d = 1.47V t_g$$

where

V = speed MPH

t_g = time gap for minor road vehicle to enter the major road

$$V = 37 \quad ISD = 353.5$$
$$t_g = 6.5$$

x $t_g = 6.5$ seconds for passenger car

$t_g = 8.5$ seconds for truck

$t_g = 10.5$ seconds for combination truck
